

CARDIOVASCULAR SYSTEM REVIEW

What are the three main types of blood vessels, their function?

1. Arteries – large blood vessels that carry blood away from the heart.
2. Capillaries – microscopic vessels that carry nutrient rich, oxygenated blood from the arteries and arterioles to the body cells.
3. Veins – conduct blood (that has given up most of its oxygen) toward the heart from the tissues.

How does oxygen get from the lungs to the blood?

Blood passing through the lung capillaries absorbs oxygen that entered the body during inhalation.

After the oxygen is in the blood where does it end up?

The newly oxygenated blood returns to the heart through the pulmonary vein. It enters the left side of the heart and is then pumped out through the aorta to all parts of the body.

What is carbon dioxide, where does it come from and how do we get rid of it.

Food is broken down at the cellular level in the presence of oxygen and carbon dioxide is released as a waste product. Oxygen-poor blood carrying carbon dioxide flows through the vena cavae to the heart. It enters the right side of the heart and into the pulmonary artery where it is expelled through the lungs.

What is the difference between blood pressure and a pulse, and how do we test them? What is a common condition that affects BP?

Blood pressure is the force that the blood exerts on the arterial walls. The pulse is the beat of the heart as felt through the walls of the arteries. Blood pressure is measured with a sphygmomanometer and the pulse is listened to with a stethoscope. A common condition that affects blood pressure is hypertension (hypertension).
