Bin Picking Approaches Classical Problem Decision:

Bin-Picking Dirk Buchholz, 2015-11-29 This book is devoted to one of the most famous examples of automation handling tasks the bin picking problem To pick up objects scrambled in a box is an easy task for humans but its automation is very complex In this book three different approaches to solve the bin picking problem are described showing how modern sensors can be used for efficient bin picking as well as how classic sensor concepts can be applied for novel bin picking techniques 3D point clouds are firstly used as basis employing the known Random Sample Matching algorithm paired with a very efficient depth map based collision avoidance mechanism resulting in a very robust bin picking approach Reducing the complexity of the sensor data all computations are then done on depth maps This allows the use of 2D image analysis techniques to fulfill the tasks and results in real time data analysis Combined with force torque and acceleration sensors a near time optimal bin picking system emerges Lastly surface normal maps are employed as a basis for pose estimation In contrast to known approaches the normal maps are not used for 3D data computation but directly for the object localization problem enabling the application of a new class of sensors for bin picking

Aleksander,2012-12-06 I ALEKSANDER

Department of Electrical Engineering and Electronics Brunel University England The three key words that appear in the title of this book need some clarification First how far does the word robot reach in the context of industrial automation There is an argument maintaining that this range is not fixed but increases with advancing technology The most limited definition of the robot is also the earliest The history is worth following because it provides a convincing backdrop to the central point of this book vision is likely to epitomize the technological advance having the greatest effect in enlarging the definition and

range of activity of robots In the mid 1950s it was foreseen that a purely mechanical arm like device could be used to move objects between two fixed locations This was seen to be cost effective only if the task was to remain fixed for some time The need to change tasks and therefore the level of programmability of the robot was a key issue in the broadening of robot activities Robots installed in industry in the early 1960s derived their programmability from a device called apinboard Ver tical wires were energized sequentially in time while horizontal wires when energized would trigger off elementary actions in the manipulator arm The task of reprogramming was a huge one as pins had to be reinserted in the board connecting steps in time with robot actions
