From Biomass to Advanced Bio-Based Chemicals & Materials: A Multidisciplinary Perspective Gabriel Paës, Caroline Rémond, Xavier Coqueret, Florent Allais, Thomas James Farmer, Warwick Douglas Raverty, 2020-04-01 Lignocellulose is the only renewable carbon source that can help replace oil based chemicals and materials in the process fighting global warming However because of its chemical and structural complexity lignocellulose transformation into advanced products requires a better understanding of its composition and of its architecture at different scales as well as a combination of physical biological and chemical processes in order to render this transformation efficient and economically competitive Tremendous efforts continue to be made toward the production of ethanol as a biofuel from various lignocellulosic feedstocks Furthermore recent successes have been achieved in extracting fibers to prepare composite materials that can compete with plastic fabrics Importantly lignocellulose chemistry can bring to the market original and complex chemicals that can lead to new applications in particular when exploiting aromatic molecules or oligosaccharides from lignocellulose to produce solvents surfactants plasticizers functional additives for food feed cosmetics drugs monomers and polymers In addition to this broad range of molecular products fibers and particles fractionated from the lignocellulosic biomass are increasingly used to elaborate bio based composite materials
