

meiosis is the process in which the number of chromosomes per cell is cut in half through the separation of homologous chromosomes in a diploid cell

- form of cell division by which gametes (sex cells) are reproduced
- sexual reproduction (genetically different cells)
- two divisions (meiosis 1 and meiosis 2)

Meiosis

- chromosomes line up and then move to separate daughter cells
- reduces the chromosome # by half
- produces 4 genetically different haploid cells

Mitosis

- when 2 sets of genetic material separate, each daughter cell receives 1 complete set of chromosomes
- does not normally change the chromosome # of the original cell
- results in the production of genetically identical diploid cells

Describe how alleles from different genes can be inherited together

Alleles of different genes tend to be inherited together from 1 generation to the next when those genes are located on the same chromosome.

Define homologous, diploid, haploid, tetrad, crossing over

homologous: term used to refer to chromosomes in which 1 set comes from the male parent and 1 set comes from the female parent

diploid:

haploid: term used to refer to a cell that contains only a single set of genes, gametes are haploid

tetrad:

crossing over: chromatids of homologous chromosomes cross over one another, crossed sections are exchanged

Where does crossing over happen?

Crossing over happens during Meiosis, prophase 1
or it happens when nonsister chromatids exchange genes

Chapter 12 Study Guide

Franklin and Watson/Crick

Role of DNA

Dna makes up gene..must be capable of storing, copying, and transmitting the genetic info in a cell. Genes, made up of DNA carry chemical codes for biological processes. It is chemical code that stores genetic info, is copied when a cell divides, and transmits info from 1 generation to the next.

What is a nucleotide?
