

## Transport in Plants

The phloem transports dissolved sugars to the rest of the plant from the leaves.

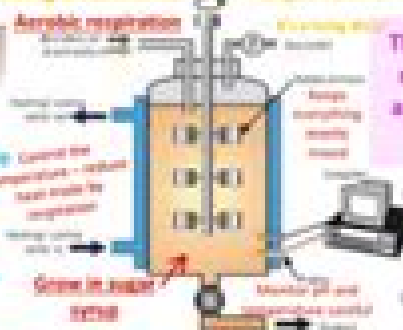

The xylem transports water and minerals up the plant from roots to leaves.

Water moves from the roots to the leaves, up the xylem via the **TRANSPIRATION STREAM**.

Plants also have a large surface area (provided by root hair cells) so they absorb most of the water and minerals a plant will need.

**Sustainable Food**  
"producing food in a way that can continue for many years"

Using a fermenter:

The way we use the earth's resources can have long and short term effects on the environment.

But we can be better contributors about the environment should be checked to ensure it is a valid idea before carrying out any experiments as we have to check the results. This is much easier said than done.

to ensure we are not contributing to an impact.

Energy lost as movement  
Energy lost as heat

**Adaptations for exchange in the intestines (absorbing your food)**

Large surface area  
Short diffusion pathway  
Only one cell between blood and air in lungs  
Good blood supply  
Can take dissolved products of digestion - using diffusion and active transport to get it from the intestine to the blood.

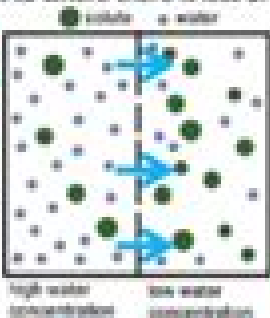

**Energy Drinks - For when your DEHYDRATED**

Contain: Water, sugar and mineral ions.  
Water - to rehydrate  
Sugar - for energy  
Minerals - to replace those lost during sweating.

**Osmosis**

WATER diffusing from where it is a lot of it to where there is less of it.

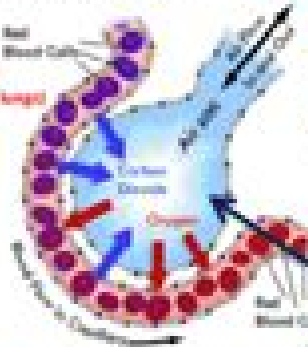

Remember: A concentrated substance usually contains less water.

# Biology Unit 3

**Adaptations for gaseous exchange (in your lungs)**

Large surface area  
Short diffusion pathway  
Only one cell between blood and air in lungs  
Steep concentration gradient.  
Remember: a substance will move from where there's a lot to where there's a little.  
This is helped with good blood supply and breathing in air (absorbing oxygen) and breathing out (releasing CO<sub>2</sub>).

**Alveoli - Air sacs in the Lungs!**  
You have loads of these wrapped in capillaries.

**Lungs**

Trachea (windpipe)

Ribs

Protect your lungs

Diaphragm

**Breathing in (inhalation)**

Diaphragm contracts flattens  
Intercostal muscles (muscles around the ribs) contract - moving ribs up and out  
Volume of lungs increases - air moves in

**Breathing in (exhalation)**

Diaphragm relaxes coming up  
Intercostal muscles (muscles around the ribs) relax - moving ribs down and in  
Volume of lungs decreases - air moves out

**Active Transport**

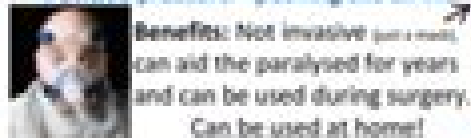

This is when some thing moves against the concentration gradient.  
Low to High!

It needs energy to happen!  
But means ions can be absorbed from soil and sugars and salts can move into cells.

**Artificial breathing**

Positive pressure - pushing the air in.

Negative pressure - a vacuum is created outside the body moving the chest up and causing air to be drawn in.

Benefits: Will keep you alive.  
Drawbacks: Very restricting and out dated. Must stay in hospital (not really used anymore).
