BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

infer, or make your best guess, about some of the abiotic factors in each of the images.

Location	Temperature	Amount of rainfall

B		
C		

Specifying these locations are all home to many trees, or living factors as well. What kinds of species do you think live in each of these places? Find five in plants, animals, birds, fish, insects, and even microscopic life like bacteria!

Chaparral

Tundra

Lastly, the **chapparral** biome is a coastal biome with hot, dry summers and mild winters. It has mostly shrubs with a few short trees. Deer, birds, and rabbits live in the chapparral.

Tundra When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Tundra** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage.

extremely nutrient rich soil. Here you'll find a variety of plants and animals. Due to their dry and hot climate, plants in both savanna and grasslands are adapted to survive relatively common fires.

Desert When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The **Desert** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage or the ability to remain dormant (similar to hibernation) for a long time.

Forest There are several different kinds of forest biomes, including: The **rainforest** is most likely the most famous forest. This lush forest is home to a wide variety of plants and animals. The **temperate forest** is home to a wide variety of plants and animals. The **coniferous forest** is home to a wide variety of plants and animals.

The **temperate forest** is common in the US, Canada, Europe, and Asia. Here you'll find a variety of plants and animals. The **coniferous forest** is common in the US, Canada, Europe, and Asia. Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. The study of biomes is called **biogeography**, or the amazing variety of life that makes our Earth so abundant in biodiversity.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could simply depend on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Marine

Freshwater

Savanna

Aquatic Biomes Since water covers over 70% of the Earth, the largest biomes are the aquatic biomes. Marine biomes include coral reefs and estuaries, but the two major ones are the marine and freshwater biomes. The **marine** biome, made up of the world's oceans, is so big it's usually divided into **deep-sea** and **shallow-sea** biomes. It's so big, the deep-sea is actually 4 times larger than all of Earth's other biomes combined. The **freshwater** biome, on the other hand, is much smaller. It includes lakes, rivers, and ponds. These are often part of the marine biomes because they do not contain salt. Freshwater biomes are especially important to us humans as they provide the water that we use to drink. All aquatic biomes provide homes for diverse plant and animal life, including many different species of fish, amphibians, and other aquatic species.

Grassland Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the **savanna** and **temperate grassland**. The **savanna** is a type of grassland that covers half of Africa and large parts of Australia. These areas have a 6-8 month wet season in the summer and a 4-6 month dry season in the winter. Elephants, giraffes, and other animals live in the savanna. The **temperate grasslands**, on the other hand, make up the plains of middle America.
