Bioremediation and Sustainability Romeela Mohee, Ackmez Mudhoo, 2012-04-02 Bioremediation and Sustainability is an up to date and comprehensive treatment of research and applications for some of the most important low cost green emerging technologies in chemical and environmental engineering Sustainable development requires the development and promotion of environmental management and a constant search for green technologies to treat a wide range of aquatic and terrestrial habitats contaminated by increasing anthropogenic activities with the main sources of contaminants being the chemical industries Bioremediation is a technique that uses living organisms in order to degrade or transform contaminants into their less toxic forms It is based on the existence of microorganisms with the capacity to attack the compounds on the enzymatic level Bioremediation is an increasingly popular low cost alternative to conventional methods for treating wastes and contaminated media with the possibility to degrade these contaminants using natural microbial activity mediated by different consortia of microbes Over the last few years the scientific literature has revealed the progressive emergence of various bioremediation techniques Bioremediation and Sustainability presents an up to date and comprehensive collection of chapters prepared in bioremediation technology research and applications The strategies covered in this volume can be applied in situ or ex situ depending on the site in which they will be applied In situ is the treatment done in the site of the contamination and ex situ involves the removal of soil or water to subsequent treatment There is a wide variety of techniques that have been developed in the past and are covered in this volume such as natural attenuation bioaugmentation biostimulation biosorption composting phytoremediation rhizoremediation and bioleaching

Ecorestoration for Sustainability Arnab Banerjee, Manoj Kumar Jhariya, Surendra Singh Bargali, Debnath Palit, 2023-07-19 A transdisciplinary approach to investigating relationships between biomass burning and human health outcomes Environmental degradation is causing severe impacts on the various Earth ecosystems Unsustainable development and anthropogenic pressure have altered the natural balance From this perspective sustainability has become a major issue to frame a greener and cleaner Earth for future generations It can be argued that the worst example of unsustainable development is habitat degradation Therefore ecorestoration and other ecological practices are becoming increasingly important in our march toward sustainability The present book covers all the aspects of ecorestoration and sustainability and how various areas intersect in this space Environmental degradation is increasing all over the world at an unprecedented rate This includes air water soil and other natural resources resulting in the depletion of natural resources and an unsustainable planet Therefore it is incredibly important to restore the ecosystem's health and services to maintain homeostasis In this context ecorestoration approaches in the form of eco friendly technologies need to be formulated to promote the protection and conservation of various ecosystems These approaches include freshwater bodies soil and mined out wasteland degraded forest biodiversity and other degraded ecosystems This important new volume from Wiley Scrivener tackles these problems from a practical

S. Nathawat,2024-05-09 Overuse of natural resources results in environmental deterioration lowering the effectiveness of important ecosystem services such as the mitigation of floods and landslides This leads to a greater risk of disaster and in turn natural hazards that can further deteriorate the environment The deterioration of the capacity of the environment to meet social and ecological aims and demands is described as environmental degradation This degradation and the concomitant reduction of ecosystems and their irreplaceable services the benefits humans gain are driving disaster risk Changes to the environment can alter the frequency and intensity of risks as well as our exposure and sensitivity to these hazards Addressing these issues requires improvement of the capacity to perform short and medium term operations in disaster management based on long term environmental considerations At the local level minimizing environmental degradation and ecosystem loss involves awareness of the links between unsustainable development and poverty Communities are often driven to ruin their natural environment as a short term coping mechanism for dealing with immediate issues for instance surviving a bad harvest by selling wood Strategies for decreasing poverty by

investing in environment sensitive development should therefore support initiatives to minimize disaster risk and build resilience There are common aspects in successful policies throughout various regions at the policy level which extends to controlling climate change Tools such as integrated water resources and coastal zone management the removal of environmentally harmful subsidies especially on fossil fuels and or carbon taxes renewable energy marine protected areas and cross boundary biodiversity conservation are all examples of policies used in more than one region but customized to each context This scoping study finds and assesses available materials that relate environmental challenges and management with catastrophes and risk reduction activities in the Asia Pacific area This volume s analysis relies on case studies examples and the results of questionnaires and interviews of practitioners and organizations operating in the environment disaster and development domains
