Molecular Aerodynamics and Direct Simulation Monte Carlo Method Gennaro Zuppari,2025-04-15 This book is aimed at illustrating that the balance equations can be derived by a method that consider the fluid dynamic system as made up of a number of molecules The book shows that 1 Equilibrium non equilibrium is associated with the absence presence of gradients of velocity temperature and chemical species in the flow field 2 In equilibrium modelled by the Maxwell equation both the Euler and the state equations are obtained 3 In non equilibrium the equations of Newton Fourier and Fick are obtained Validity of these equations therefore of the Navier Stokes equations is linked to the condition that the shift from equilibrium quantified by a small perturbation of the Maxwell distribution has to be small 4 Considering a second order perturbation term in the distribution function produces the Burnett equations Nowadays the solution of rarefied flow fields

A. Brebbia, P. Vorobieff, 2013-07-03

Multiphase flows are found in all areas of technology at all length scales and flow regimes and can involve compressible or incompressible linear or nonlinear fluids. However, although they are ubiquitous, multiphase flows continue to be one of the most challenging areas of computational mechanics with numerous problems as yet unsolved. Advanced computational and experimental methods are often required to solve the equations that describe such complex problems. The many challenges that must be faced in solving them include modelling nonlinear fluids, modelling and tracking interfaces, dealing with multiple length scales, characterising phase structures and treating drop break up and coalescence. It is important to validate models which calls for the use of expensive and difficult experimental techniques. This book presents contributions on the latest research in the techniques for solving multiphase flow problems presented at the seventh in a biennial series of conferences on the subject that began in 2001. Featured topics include Flow in porous media, Turbulent flow, Multiphase flow simulation, Image processing, Heat transfer, Atomization, Interface behaviour, Oil and gas applications, Experimental measurements, Energy applications, Biological flows, Micro and macro fluids, Compressible flows.
