**8** Anticipation Guide

## Rational Expressions and Equations

**STEP 1**

Before you begin Chapter 8

- Read each statement.
- Decide whether you Agree (A) or Disagree (D) with the statement.
- Write A or D in the first column OR if you are not sure whether you agree or disagree, write NS (Not Sure).

| STEP 1<br>A, D, or NS | Statement                                                                                                                                                   | STEP 2<br>A or D |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
|                       | 1. Since a denominator cannot equal 0, the expression $\frac{3x^2 - 1}{1 + x}$ is undefined for $x = -1$ .                                                  | <b>A</b>         |
|                       | 2. To divide two rational expressions, multiply by the reciprocal of the divisor.                                                                           | <b>A</b>         |
|                       | 3. The least common multiple of three expressions is found by multiplying the numerators together.                                                          | <b>D</b>         |
|                       | 4. When adding two rational expressions, a common denominator must be found.                                                                                | <b>A</b>         |
|                       | 5. The graph of a rational function containing an asymptote will be symmetric over the asymptote.                                                           | <b>D</b>         |
|                       | 6. Since $f(x) = \frac{(x + 3)(x - 2)}{x + 4}$ can be simplified to $f(x) = x - 1$ , the graph of $f(x)$ will be the straight line defined by $y = x - 1$ . | <b>D</b>         |
|                       | 7. $y = \text{any}$ is an example of a joint variation if $k$ , $x$ , $y$ , and $z$ are all not equal to 0.                                                 | <b>A</b>         |
|                       | 8. The shape of the graph of $y = -3x^2 - 2x + 4$ can only be determined by graphing the function.                                                          | <b>D</b>         |
|                       | 9. Because the graph of an absolute value function is the shape of a V, the graph of $y =  x  + 4$ will not be in the shape of a V.                         | <b>A</b>         |
|                       | 10. When solving rational equations, solutions that result in a zero in the denominator must be excluded.                                                   | <b>A</b>         |

**STEP 2**

After you complete Chapter 8

- Revisit each statement and explain the last column by entering an A or a D.
- Did any of your opinions about the statements change from the first column?
- For those statements that you mark with a D, use a piece of paper to write an example of why you disagree.

**8-1** Lesson Reading Guide

## Multiplying and Dividing Rational Expressions

## Get Ready for the Lesson

Read the introduction to Lesson 8-1 in your textbook.

- Suppose that the Double-Flapper also sells a variety of instant noodle bowls. A bowl of double noodles and 2 pounds of carrots, then  $\frac{4 + y}{7 + y}$  of the mixture is made and  $\frac{1}{7}$  of the mixture is carrots. If the more manager adds another 7 pounds of carrots to the mixture, what fraction of the mixture will be carrots?

$$\frac{4 + y}{7 + y}$$

## Read the Lesson

- 1.6. In order to multiply a rational number or rational expression, factor the numerator and denominator and divide both of them by their greatest common factor.

- 1.7. A rational expression is undefined when its denominator is equal to 0. To find the values that make the expression undefined, simplify the original denominator and set each factor equal to 0.

- 1.8. To multiply two rational expressions, multiply the numerators and multiply the denominators.

- 1.9. To divide two rational expressions, multiply by the reciprocal of the divisor.

- 1.10. Which of the following expressions are complex fractions? **A, B, C**

$$1. \frac{1}{11} \quad 2. \frac{1}{4} \quad 3. \frac{2 + 3}{7 - 1} \quad 4. \frac{1.2}{1} \quad 5. \frac{2}{1} \quad 6. \frac{1}{1.2}$$

- 1.11. Does a complex fraction express a multiplication or division problem? division (This is multiplication and is simplifying a complex fraction.) **Sample answer:** To divide the numerator of the complex fraction by the denominator, multiply the numerator by the reciprocal of the denominator.

## Remember What You Learned

- 1.12. One way to remember something new is to see how it is similar to something you already know. How can your knowledge of division of fractions be similarly help you to understand how to divide rational expressions? **Sample answer:** To divide rational expressions, multiply the first expression by the reciprocal of the second. This is the same "invert and multiply" process that is used when dividing arithmetic fractions.
