Antennas For Base Stations In Wireless Communications:

Biblia ili Knigi Svcestenalago Pisanie Vetchago i Novago Zaveta , Handbook of Antennas in Wireless Communications Lal Chand Godara, 2018-10-03 The move toward worldwide wireless communications continues at a remarkable pace and the antenna element of the technology is crucial to its success With contributions from more than 30 international experts the Handbook of Antennas in Wireless Communications brings together all of the latest research and results to provide engineering professionals and students with a one stop reference on the theory technologies and applications for indoor hand held mobile and satellite systems Beginning with an introduction to wireless communications systems it offers an in depth treatment of propagation prediction and fading channels It then explores antenna technology with discussion of antenna design methods and the various antennas in current use or development for base stations hand held devices satellite communications and shaping beams The discussions then move to smart antennas and phased array technology including details on array theory and beamforming techniques Space diversity direction of arrival estimation source tracking and blind source separation methods are addressed as are the implementation of smart antennas and the results of field trials of systems using smart antennas implemented Finally the hot media topic of the safety of mobile phones receives due attention including details of how the human body interacts with the electromagnetic fields of these devices Its logical development and extensive range of diagrams figures and photographs make this handbook easy to follow and provide a clear understanding of design techniques and the performance of finished products Its unique comprehensive coverage written by top experts in their fields promises to make the Handbook of Antennas in Wireless Communications the standard reference for the field Blind Massive MIMO Base Stations Marcus Karlsson, 2018-08-15 Massive MIMO Multiple Input Multiple Output is a cellular network technology in which the base station is equipped with a large number of antennas and aims to serve several different users simultaneously on the same frequency resource through spatial multiplexing This is made possible by employing efficient beamforming based on channel estimates acquired from uplink reference signals where the base station can transmit the signals in such a way that they add up constructively at the users and destructively elsewhere The multiplexing together with the array gain from the beamforming can increase the spectral efficiency over contemporary systems One challenge of practical importance is how to transmit data in the downlink when no channel state information is available When a user initially joins the network prior to transmitting uplink reference signals that enable beamforming it needs system information instructions on how to properly function within the network It is transmission of system information that is the main focus of this thesis In particular the thesis analyzes how the reliability of the transmission of system information depends on the available amount of diversity It is shown how downlink reference signals space time block codes and power allocation can be used to improve the reliability of this transmission In order to estimate the uplink and downlink channels from uplink reference signals which is imperative to ensure scalability in the number of base station

antennas massive MIMO relies on channel reciprocity This thesis shows that the principles of channel reciprocity can also be exploited by a jammer a malicious transmitter aiming to disrupt legitimate communication between two single antenna devices A heuristic scheme is proposed in which the jammer estimates the channel to a target device blindly without any knowledge of the transmitted legitimate signals and subsequently beamforms noise towards the target Under the same power constraint the proposed jammer can disrupt the legitimate link more effectively than a conventional omnidirectional jammer in many cases

Massiv MIMO eng Multiple Input Multiple Output r en teknologi inom cellulär kommunikation som förutsätter att en betydande roll i framtida kommunikationssystem på grund av de många fördelarna som denna teknologi medför. Massiv MIMO innebär att basstationen har ett stort antal antenner där varje antenn kan styras individuellt. De många antennerna gör att basstationen kan rikta de elektromagnetiska signalerna på ett sådant sätt att de förstärks på positioner där användarna befinner sig men släcks ut i övrigt. Detta i sin tur innebär att flera användare kan betjänas samtidigt på samma frekvensband utan att de stör varandra. Detta medför att massiv MIMO kan erbjuda en hög dataakt i nutida cellulära kommunikationssystem. För att kunna rikta signalerna på ett effektivt sätt måste basstationen känna till kanalen eller utbredningsmiljön mellan sig själv och de användare som betjänas. När en användare precis kommer in i systemet vet basstationen inte var användaren befinner sig men måste likväl tillgodose användaren med information om hur systemet fungerar. Nu måste alltså basstationen kommunicera med användaren utan möjligheten att kunna rikta signalen på ett effektivt sätt. Det är detta problem som vi i huvudsak studerar i denna avhandling hur man kan utnyttja de många antennerna på basstationen för att skicka information till användarna utan någon kanalkänedom. Vi studerar även hur en gruppantenn med många antenner baserad på samma teknologi som massiv MIMO kan användas som en störsändare. Störsändarens mål är att hindra kommunikationen mellan tv enheter på ett effektivt sätt. En störsändare med ett stort antal antenner kan utan någon kanalkänedom av vad de tv enheterna skickar i många fall prestera bättre än en konventionell störsändare på grund av att störsignalen kan riktas mot en specifik enhet.
