Bernstein Functions Bernstein Functions:

Bernstein Functions René L. Schilling, Renming Song, Zoran Vondracek, 2012-10-01 Bernstein functions appear in various fields of mathematics e g probability theory potential theory operator theory functional analysis and complex analysis often with different definitions and under different names Among the synonyms are Laplace exponent instead of Bernstein function and complete Bernstein functions are sometimes called Pick functions Nevanlinna functions or operator monotone functions This monograph now in its second revised and extended edition offers a self contained and unified approach to Bernstein functions and closely related function classes bringing together old and establishing new connections For the second edition the authors added a substantial amount of new material As in the first edition Chapters 1 to 11 contain general material which should be accessible to non specialists while the later Chapters 12 to 15 are devoted to more specialized topics An extensive list of complete Bernstein functions with their representations is provided

Bernstein Functions René L. Schilling, Renming Song, Zoran Vondraček, 2012 This second revised and extended edition of the self contained and unified approach to Bernstein functions and their subclasses brings together old and establishes new connections Applications of Bernstein functions in different fields of mathematics such as probability theory potential theory operator theory integral equations functional calculi and complex analysis are given with special attention to interpretations in probability theory An extensive list of complete Bernstein functions with their representations is provided

Completely Monotone and Bernstein Functions with Convexity Properties on Their Measures Shen Shan, 2015 The concepts of completely monotone and Bernstein functions have been introduced near one hundred years ago They find wide applications in areas ranging from stochastic Levy processes and complex analysis to monotone operator theory They have well known Bernstein and Levy Khintchine integral representations through which there are one to one correspondences between them and Radon measures on $[0, \infty)$ or $[0, \infty]$ respectively In this thesis we investigate subclasses of completely monotone and Bernstein functions with various convexity properties on their measures These subclasses have intriguing applications in probability theories and convex analysis The convexity properties we investigate include convexity harmonic convexity and convexity of the cumulative distribution functions We characterize measures with various convexity properties to obtain results analogous to the classical Plya's Theorem Then we apply these characterizations of the measures to derive integral representations for these classes of completely monotone and Bernstein functions that are variants of the classical Bernstein and Levy Khintchine integral representations To explore the connections among completely monotone and Bernstein functions with various convexity properties on their measures we investigate the characterizations and obtain various necessary and sufficient conditions for a completely monotone or Bernstein function to belong to one of the subclasses We also identify maps that transform completely monotone and Bernstein functions into one with certain convexity properties on their measures Interesting parallels between completely monotone and Bernstein functions are observed For example the transformation

that turn a Bernstein function into one having Lévy measure with harmonically concave tail is the same as the transformation that turns a completely monotone function into one having harmonically convex measure To help understand these analogies a criteria for completely monotone and Bernstein function to have measures with convexity property is obtained That generalizes the conditions for both convexity and harmonic convexity Let HCM be the set of all Bernstein functions h such that $f \circ h$ is the Laplace transform of a harmonically convex measure for any completely monotone function f Similarly let HBF be the set of all Bernstein functions h such that $g \circ h$ has Lévy measure with harmonically concave tail for any Bernstein function g Surprisingly we show that HCM HBF and are non empty For example we prove that x is in HBF for any $0 < x < 1$ In other words the Bernstein function $x \mapsto x$ is a transformation that deforms the measure of any Bernstein resp completely monotone function into one that not only has a continuous distribution function on $(0, \infty)$ but also a convenient concavity resp convexity property We give necessary and sufficient condition for a Bernstein function to be in HBF in terms of its convolution semigroups of sub probability measures However it is not well understood what are the functions that generate this set We hope to investigate such issues in the future

Convex Functions and Their Applications Constantin P. Niculescu, Lars-Erik Persson, 2025-03-11 This third edition presents an expanded and updated treatment of convex analysis methods incorporating many new results that have emerged in recent years These additions are essential for grasping the practical applications of convex function theory in solving contemporary real world problems To reflect these advancements the material has been meticulously reorganized with a greater emphasis on topics relevant to current research Additionally great care has been taken to ensure that the text remains accessible to a broad audience including both students and researchers focused on the application of mathematics Ideal for undergraduate courses graduate seminars or as a comprehensive reference this book is an indispensable resource for those seeking to understand the extensive potential of convex function theory

Pseudo Differential Operators & Markov Processes Niels Jacob, 2005 This volume concentrates on how to construct a Markov process by starting with a suitable pseudo differential operator Feller processes Hunt processes associated with L_p sub Markovian semigroups and processes constructed by using the Martingale problem are at the center of the considerations The potential theory of these processes is further developed and applications are discussed Due to the non locality of the generators the processes are jump processes and their relations to Lévy processes are investigated Special emphasis is given to the symbol of a process a notion which generalizes that of the characteristic exponent of a Lévy process and provides a natural link to pseudo differential operator theory

Fractional Equations and Models Trifce Sandev, Živorad Tomovski, 2019-11-23 Fractional equations and models play an essential part in the description of anomalous dynamics in complex systems Recent developments in the modeling of various physical chemical and biological systems have clearly shown that fractional calculus is not just an exotic mathematical theory as it might have once seemed The present book seeks to demonstrate this using various examples of equations and models with fractional and generalized operators Intended for

students and researchers in mathematics physics chemistry biology and engineering it systematically offers a wealth of useful tools for fractional calculus

The Combinatorics of Bernstein Functions Thomas J. Haines, 1999 *Special Functions for Applied Scientists* A.M. Mathai, H.J. Haubold, 2008-02-13 Chapter 1 introduces elementary classical special functions Gamma beta psi zeta functions hypergeometric functions and the associated special functions generalizations to Meijer s G and Fox s H functions are examined here Discussion is confined to basic properties and selected applications Introduction to statistical distribution theory is provided Some recent extensions of Dirichlet integrals and Dirichlet densities are discussed A glimpse into multivariable special functions such as Appell s functions and Lauricella functions is part of Chapter 1 Special functions as solutions of differential equations are examined Chapter 2 is devoted to fractional calculus Fractional integrals and fractional derivatives are discussed Their applications to reaction diffusion problems in physics input output analysis and Mittag Leffler stochastic processes are developed Chapter 3 deals with q hyper geometric or basic hypergeometric functions Chapter 4 covers basic hypergeometric functions and Ramanujan s work on elliptic and theta functions Chapter 5 examines the topic of special functions and Lie groups Chapters 6 to 9 are devoted to applications of special functions Applications to stochastic processes geometric infinite divisibility of random variables Mittag Leffler processes alpha Laplace processes density estimation order statistics and astrophysics problems are dealt with in Chapters 6 to 9 Chapter 10 is devoted to wavelet analysis An introduction to wavelet analysis is given Chapter 11 deals with the Jacobians of matrix transformations Various types of matrix transformations and the associated Jacobians are provided Chapter 12 is devoted to the discussion of functions of matrix argument in the real case Functions of matrix argument and the pathway models along with their applications are discussed

Stochastic Analysis and Applications to Finance Tusheng Zhang, Xun Yu Zhou, 2012 A collection of solicited and refereed articles from distinguished researchers across the field of stochastic analysis and its application to finance It covers the topics ranging from Markov processes backward stochastic differential equations stochastic partial differential equations and stochastic control to risk measure and risk theory

Loewner's Theorem on Monotone Matrix Functions Barry Simon, 2019-08-29 This book provides an in depth discussion of Loewner s theorem on the characterization of matrix monotone functions The author refers to the book as a love poem one that highlights a unique mix of algebra and analysis and touches on numerous methods and results The book details many different topics from analysis operator theory and algebra such as divided differences convexity positive definiteness integral representations of function classes Pick interpolation rational approximation orthogonal polynomials continued fractions and more Most applications of Loewner s theorem involve the easy half of the theorem A great number of interesting techniques in analysis are the bases for a proof of the hard half Centered on one theorem eleven proofs are discussed both for the study of their own approach to the proof and as a starting point for discussing a variety of tools in analysis Historical background and inclusion of pictures of some of the main figures who have developed the subject adds

another depth of perspective The presentation is suitable for detailed study for quick review or reference to the various methods that are presented The book is also suitable for independent study The volume will be of interest to research mathematicians physicists and graduate students working in matrix theory and approximation as well as to analysts and mathematical physicists
