Collision Documentation Christopher D Armstrong,2018-11-02 The last ten years have seen explosive growth in the technology available to the collision analyst changing the way reconstruction is practiced in fundamental ways The greatest technological advances for the crash reconstruction community have come in the realms of photogrammetry and digital media analysis The widespread use of scanning technology has facilitated the implementation of powerful new tools to digitize forensic data create 3D models and visualize and analyze crash vehicles and environments The introduction of unmanned aerial systems and standardization of crash data recorders to the crash reconstruction community have enhanced the ability of a crash analyst to visualize and model the components of a crash reconstruction Because of the technological changes occurring in the industry many SAE papers have been written to address the validation and use of new tools for collision reconstruction Collision Reconstruction Methodologies Volumes 1 12 bring together seminal SAE technical papers surrounding advancements in the crash reconstruction field Topics featured in the series include Night Vision Study and Photogrammetry Vehicle Event Data Recorders Motorcycle Heavy Vehicle Bicycle and Pedestrian Accident Reconstruction The goal is to provide the latest technologies and methodologies being introduced into collision reconstruction appealing to crash analysts consultants and safety engineers alike Click here to purchase the entire set at a discount

Surveying for Engineers J. Uren,William Frank Price,2006 Surveying engineering geomatics geospatial technology Geographic Information System GIS remote sensing [The Military Engineer](#) ,1986 **Surveying for Engineers** John Uren,Bill Price,2018-03-13 The fifth edition of this classic textbook sets out the essential techniques needed for a solid grounding in the surveying The popular and trusted textbook covers the traditional topics such as levelling measurement of angles measuring distances and how to carry out traversing and compute coordinates as well as the latest technological advances It is packed with clear illustrations exercises and worked examples making it both a comprehensive study aid for students and a reliable reference tool for practitioners This text is aimed at students studying surveying as either part of a civil engineering building or construction course or as a separate discipline It is also useful for students who undertake surveying as an elective subject and is a useful resource for practising surveyors New to this Edition The latest developments in Global Navigation Satellite Systems GNSS particularly the introduction of network RTK and OS Net and their applications Recent developments in survey instruments methods and digital technologies including image processing with total stations and laser planners developments in data processing and integration and updates on Ordnance Survey

Jonathan A. Czuba,Christiana R. Czuba,Christopher S. Magirl,Frank D. Voss,2010-12-01 Draining the volcanic glaciated terrain of Mount Rainier Washington the Puyallup White and Carbon Rivers convey copious volumes of water and sediment down to Commencement Bay in Puget Sound Recent flooding in the lowland river system has renewed interest in understanding sediment transport and its effects on flow conveyance throughout the lower drainage basin Bathymetric and topographic data for 156 cross sections were surveyed in the lower Puyallup River system by the U S Geological Survey USGS and were compared with similar datasets collected in 1984 Regions of significant aggradation were measured along the Puyallup and White Rivers Between 1984 and 2009 aggradation totals as measured by changes in average channel elevation were as much as 7 5 6 5 and 2 feet on the Puyallup White and Carbon Rivers respectively These aggrading river sections correlated with decreasing slopes in riverbeds where the rivers exit relatively confined sections in the upper drainage and enter the relatively unconstricted valleys of the low gradient Puget Lowland Measured grain size distributions from each riverbed showed a progressive fining downstream Analysis of stage discharge relations at streamflow gaging stations along rivers draining Mount Rainier demonstrated the dynamic nature of channel morphology on river courses influenced by glaciated volcanic terrain The greatest rates of aggradation since the 1980s were in the Nisqually River near

National 5 0 inches per year and the White River near Auburn 1 8 inches per year Less pronounced aggradation was measured on the Puyallup River and the White River just downstream of Mud Mountain Dam The largest measured rate of incision was measured in the Cowlitz River at Packwood 5 0 inches per year Channel conveyance capacity estimated using a one dimensional hydraulic model decreased in some river reaches since 1984 The reach exhibiting the largest decrease about 20 50 percent in channel conveyance capacity was the White River between R Street Bridge and the Lake Tapps return a reach affected by recent flooding Conveyance capacity also decreased in sections of the Puyallup River Conveyance capacity was mostly unchanged along other study reaches Bedload transport was simulated throughout the entire river network and consistent with other observations and analyses the hydraulic model showed that the upper Puyallup and White Rivers tended to accumulate sediment Accuracy of the bedload transport modeling however was limited due to a scarcity of sediment transport data sets from the Puyallup system mantling of sand over cobbles in the lower Puyallup and White Rivers and overall uncertainty in modeling sediment transport in gravel bedded rivers Consequently the output results from the model were treated as more qualitative in value useful in comparing geomorphic trends within different river reaches but not accurate in producing precise predictions of mass of sediment moved or deposited The hydraulic model and the bedload transport component were useful for analyzing proposed river management options if surveyed cross sections adequately represented the river management site and proposed management options The hydraulic model showed that setback levees would provide greater flood protection than gravel bar scalping after the initial project construction and for some time thereafter although the model was not accurate enough to quantify the length of time of the flood protection The greatest hydraulic benefit from setback levees would be a substantial increase in the effective channel conveyance area By widening the distance between levees the new floodplain would accommodate larger increases in discharge with relatively small incremental increases in stage Model simulation results indicate that the hydraulic benefit from a setback levee also would be long lived and would effectively compensate for increased deposition within the setback reach from increased channel conveyance capacity In contrast the benefit from gravel bar scalping would be limited by the volume of material that could be removed and the underlying hydraulics in the river section that would be mostly unaffected by scalping Finally the study formulated an explanation of the flooding that affected Pacific Washington in January 2009 Reduction in channel conveyance capacity of about 25 percent at the White River near Auburn streamflow gaging station between November 2008 and January 2009 was caused by rapid accumulation of coarse grained sediment just downstream of the gage continuing an ongoing trend of aggradation that has been documented repeatedly
