Algorithms to Live By Brian Christian, Tom Griffiths, 2016-04-19 An exploration of how computer algorithms can be applied to our everyday lives to solve common decision making problems and illuminate the workings of the human mind What should we do or leave undone in a day or a lifetime How much messiness should we accept What balance of the new and familiar is the most fulfilling These may seem like uniquely human quandaries but they are not Computers like us confront limited space and time so computer scientists have been grappling with similar problems for decades And the solutions they ve found have much to teach us In a dazzlingly interdisciplinary work Brian Christian and Tom Griffiths show how algorithms developed for computers also untangle very human questions They explain how to have better hunches and when to leave things to chance how to deal with overwhelming choices and how best to connect with others From finding a spouse to finding a parking spot from organizing one s inbox to peering into the future Algorithms to Live By transforms the wisdom of computer science into strategies for human living

Interactive Cinema Marina Hassapopoulou, 2024-06-25 Connecting interactive cinema to media ethics and global citizenship Interactive Cinema explores various cinematic practices that work to transform what is often seen as a primarily receptive activity into a participatory multimedia experience Surveying a multitude of unorthodox approaches throughout the history of motion pictures Marina Hassapopoulou offers insight into a range of largely ephemeral and site specific projects that consciously assimilate viewers into their production Analyzing examples of early cinema Hollywood B movies museum and gallery installations virtual reality experiments and experimental web based works Hassapopoulou travels across numerous platforms highlighting a diverse array of strategies that attempt to unsettle the allegedly passive spectatorship of traditional cinema Through an exploration of these radically inventive approaches to the medium many of which emerged out of sociopolitical crises and periods of historical transition she works to expand notions of interactivity by considering it in both technological and phenomenological terms Deliberately revising and expanding Eurocentric scholarship to propose a much broader transnational scope the book emphasizes the ethical dimensions of interactive media and their links to larger considerations around community building citizenship and democracy By combining cutting edge theory with updated conventional film studies methodologies Interactive Cinema presses at the conceptual limits of cinema and offers an essential road map to the rapidly evolving landscape of contemporary media

Stream Data Management Nauman Chaudhry, Kevin Shaw, Mahdi Abdelguerfi, 2005-09-19 Researchers in data management have recently recognized the importance of a new class of data intensive applications that requires managing data streams i.e. data composed of continuous real time sequence of items Streaming applications pose new and interesting challenges for data management systems Such application domains require queries to be evaluated continuously as opposed to the one time evaluation of a query for traditional applications Streaming data sets grow continuously and queries must be evaluated on such unbounded data sets These as well as other challenges require a major rethink of almost all aspects of traditional database management systems to support streaming applications Stream Data

Management comprises eight invited chapters by researchers active in stream data management The collected chapters provide exposition of algorithms languages as well as systems proposed and implemented for managing streaming data Stream Data Management is designed to appeal to researchers or practitioners already involved in stream data management as well as to those starting out in this area This book is also suitable for graduate students in computer science interested in learning about stream data management

Algorithms for Personalized Search in Self-organizing Information Networks Sep Kamvar,2010-09-07 This book lays out the theoretical groundwork for personalized search and reputation management both on the Web and in peer to peer and social networks Representing much of the foundational research in this field the book develops scalable algorithms that exploit the graphlike properties underlying personalized search and reputation management and delves into realistic scenarios regarding Web scale data Sep Kamvar focuses on eigenvector based techniques in Web search introducing a personalized variant of Google s PageRank algorithm and he outlines algorithms such as the now famous quadratic extrapolation technique that speed up computation making personalized PageRank feasible Kamvar suggests that Power Method related techniques ultimately should be the basis for improving the PageRank algorithm and he presents algorithms

that exploit the convergence behavior of individual components of the PageRank vector Kamvar then extends the ideas of reputation management and personalized search to distributed networks like peer to peer and social networks He highlights locality and computational considerations related to the structure of the network and considers such unique issues as malicious peers He describes the EigenTrust algorithm and applies various PageRank concepts to P2P settings Discussion chapters summarizing results conclude the book s two main sections Clear and thorough this book provides an authoritative look at central innovations in search for all of those interested in the subject
