THE NIHSS AT 24 HOURS TO MEASURE TREATMENT EFFECT IN TRIALS OF ACUTE STROKE Nadinda van Ende,2017

BackgroundNIH stroke scale NIHSS is increasingly used as outcome in RCTs of acute stroke treatment but no consensus exists on how to analyze the effect of treatment on NIHSS Our aim is to study what the best approach is to analyze this important early indicator of treatment effect

MethodsWe used the data from the MR CLEAN trial n 500 in a bootstrap analysis with 5000 runs to estimate valid and generalizable treatment effect parameters based on NIHSS Missing values for pertinent outcome and baseline variables were imputed with single regression if less than 4% NIHSS was analyzed with 5 different approaches identified in the literature For the approaches that used regression models unadjusted and adjusted estimates for age baseline NIHSS and collateral score were calculated We added the effect on mRS for comparison We compared the effect estimates between the different approaches and the Z statistic as a measure that combines strength of the effect and precision

ResultsBaseline characteristics were evenly distributed between intervention and control NIHSS scores at 24 h and 1 week were available with less than 1% and 4% missing values The absolute z value of the regression model of the effect of EVT on mRS at 3 months was 3.12 and 3.15 after adjustment Z values or any type of effect analysis of NIHSS at 1 week were not better than those at 24 hours data on poster figure Z values for plain NIHSS and change in NIHSS from baseline were substantially lower than the reference value Z values for dichotomized NIHSS exceeded the reference only for two of the three dichotomizations The z value of the effect parameter Δ improvement Δ exceeded the reference but only barely so for fair improvement The effect parameter difference in log NIHSS at 24h exceeded the reference

DiscussionUsing plain NIHSS or change in NIHSS in a linear regression model to estimate the effect of acute stroke treatment is not an efficient and sensitive approach Dichotomizing the NIHSS in good outcome or improvement seems efficient but the best cut point will vary unpredictably depending on the patient population and chance We conclude that analysis of the effect of treatment on the full NIHSS scale with linear regression on log transformed data provides an efficient way to analyze early treatment effects with the NIH stroke scale
