Levels of physical activity are alarmingly low around the world. This is an ominous trend as numerous studies support the importance of engaging in physical activity for improving and/or maintaining a good health status across the lifespan. An emerging field of research also highlights the positive effect of physical activity on brain health in particular for the promotion of cognitive functioning across the lifespan and the prevention of mental disorders in later life. According to the World Health Organization (WHO), brain health can be defined as the state of brain functioning across cognitive, sensory, social, emotional, behavioral, and motor domains, allowing a person to realize their full potential over the life course, irrespective of the presence or absence of disorders. Therefore, the concept of brain health includes not only measurements of biological markers of the brain, e.g., structural brain morphology, but also psychological well-being, e.g., depressive symptoms, and well-being, e.g., self-esteem indicators, perceptions of quality of life, and cognitive function, e.g., attention and memory.
