Boron Separation Processes:

Boron Separation Processes Nalan Kabay, Marek Bryjak, Nidal Hilal, 2015-01-19 The impending crisis posed by water stress and poor sanitation represents one of the greatest human challenges for the 21st century and membrane technology has emerged as a serious contender to confront the crisis. Yet whilst there are countless texts on wastewater treatment and on membrane technologies, none address the boron problem and separation processes for boron elimination. *Boron Separation Processes* fills this gap and provides a unique and single source that highlights the growing and competitive importance of these processes. For the first time, the reader is able to see in one reference work the state of the art research in this rapidly growing field. The book focuses on four main areas: Effect of boron on humans and plants; Separation of boron by ion exchange and adsorption processes; Separation of boron by membrane processes; Simulation and optimization studies for boron separation. Provides in one source a state of the art overview of this compelling area. Reviews the environmental impact of boron before introducing emerging boron separation processes. Includes simulation and optimization studies for boron separation processes. Describes boron separation processes applicable to specific sources such as seawater, geothermal water and wastewater.

Geothermal Water Management Jochen Bundschuh, Barbara Tomaszewska, 2018-03-12 Availability of and adequate accessibility to freshwater and energy are two key technological and scientific problems of global significance. At the end of the 20th century, the deficit of water for human consumption and economic application forced us to focus on rational use of resources. Increasing the use of renewable energy sources and improving energy efficiency is a challenge for the 21st century. Geothermal energy is heat energy generated and stored in the Earth, accumulated in hydrothermal systems or in dry rocks within the Earth's crust in amounts which constitute the energy resources. The sustainable management of geothermal energy resources should be geared towards optimization of energy recovery but also towards rational management of water resources since geothermal water serves both as energy carrier and also as valuable raw material. Geothermal waters, depending on their hydrogeothermal characteristics, the lithology of the rocks involved, the depth at which the resources occur and the sources of water supply, may be characterized by very diverse physicochemical parameters. This factor largely determines the technology to be used in their exploitation and the way the geothermal water can be used. This book is focused on the effective use of geothermal water and renewable energy for future needs in order to promote modern, sustainable and effective management of water resources. The research field includes crucial new areas of study: an improvement in the management of freshwater resources through the use of residual geothermal water; a review of the technologies available in the field of geothermal water treatment for its re-use for energetic purposes and freshwater production and the development of balneotherapy. The book is aimed at professionals, academics and decision makers worldwide: water sector representatives and administrators, business enterprises specializing in renewable energy management and water treatment, working in the areas of geothermal energy usage, water resources, water supply and

energy planning This book has the potential to become a standard text used by educational institutions and research development establishments involved in the geothermal water management **Nuclear Science Abstracts** ,1975-04
