Black-eyed Frog

Amphibians are cold-blooded, meaning they cannot regulate their body temperature internally. They must live in a moist environment to keep their skin from drying out.

1. **Life Cycle:** Most frogs lay eggs in water or a moist area. The eggs hatch into tadpoles, which live in water and breathe through gills. As they grow, they develop lungs and a tail that eventually disappears. They then become adult frogs, which can live on land or in water.
2. **Adaptations:** Black-eyed Frogs have several adaptations that help them survive in their environment. They have large, powerful hind legs that allow them to jump great distances. They also have a long, sticky tongue that they use to catch their food. Additionally, they have a protective layer of mucus on their skin that helps them stay moist.
3. **Reproduction:** Black-eyed Frogs are oviparous, meaning they lay eggs. The eggs are typically laid in a cluster and are attached to a substrate. The parents usually guard the eggs and provide care for the young after they hatch.
4. **Conservation:** Black-eyed Frogs are considered a species of concern because their populations are declining in many areas. This is due to factors such as habitat loss, pollution, and climate change. Conservation efforts are being made to protect these frogs and their habitats.
