Differential and Differential-Algebraic Systems for the Chemical Engineer Guido Buzzati-Ferraris, Flavio Manenti, 2015-01-12 Engineers and other applied scientists are frequently faced with models of complex systems for which no rigorous mathematical solution can be calculated To predict and calculate the behaviour of such systems numerical approximations are frequently used either based on measurements of real life systems or on the behaviour of simpler models This is essential work for example for the process engineer implementing simulation control and optimization of chemical processes for design and operational purposes This fourth in a suite of five practical guides is an engineer's companion to using numerical methods for the solution of complex mathematical problems It explains the theory behind current numerical methods and shows in a step by step fashion how to use them The volume focuses on differential and differential algebraic systems providing numerous real life industrial case studies to illustrate this complex topic It describes the methods innovative techniques and strategies that are all implemented in a freely available toolbox called BzzMath which is developed and maintained by the authors and provides up to date software tools for all the methods described in the book Numerous examples sample codes programs and applications are taken from a wide range of scientific and engineering fields such as chemical engineering electrical engineering physics medicine and environmental science As a result engineers and scientists learn how to optimize processes even before entering the laboratory With additional online material including the latest version of BzzMath Library installation tutorial all examples and sample codes used in the book and a host of further examples

Walas, 1991 Modelling with Differential Equations in Chemical Engineering covers the modelling of rate processes of engineering in terms of differential equations While it includes the purely mathematical aspects of the solution of differential equations the main emphasis is on the derivation and solution of major equations of engineering and applied science Methods of solving differential equations by analytical and numerical means are presented in detail with many solved examples and problems for solution by the reader Emphasis is placed on

numerical and computer methods of solution A key chapter in the book is devoted to the principles of mathematical modelling These principles are applied to the equations in important engineering areas The major disciplines covered are thermodynamics diffusion and mass transfer heat transfer fluid dynamics chemical reactions and automatic control These topics are of particular value to chemical engineers but also are of interest to mechanical civil and environmental engineers as well as applied scientists The material is also suitable for undergraduate and beginning graduate students as well as for review by practising engineers
