Intelligent Systems Crina Grosan, Ajith Abraham, 2011-07-29 Computational intelligence is a well-established paradigm where new theories with a sound biological understanding have been evolving. The current experimental systems have many of the characteristics of biological computers: brains in other words, and are beginning to be built to perform a variety of tasks that are difficult or impossible to do with conventional computers. As evident, the ultimate achievement in this field would be to mimic or exceed human cognitive capabilities including reasoning, recognition, creativity, emotions, understanding, learning, and so on. This book, comprising of 17 chapters, offers a step-by-step introduction in a chronological order to the various modern computational intelligence tools used in practical problem solving. Starting with different search techniques including informed and uninformed search, heuristic search, minmax, alpha-beta pruning, methods, evolutionary algorithms, and swarm intelligent techniques, the authors illustrate the design of knowledge-based systems and advanced expert systems which incorporate uncertainty and fuzziness. Machine learning algorithms including decision trees and artificial neural networks are presented, and finally the fundamentals of hybrid intelligent systems are also depicted. Academics, scientists, as well as engineers engaged in research, development, and application of computational intelligence techniques, machine learning, and data mining would find the comprehensive coverage of this book invaluable.
