There is a close link at the biological between. Each is formed by a series of plants and animals that are bound together. Although they are not bound together in the same way, there is a close link at the level of differences too. Many of these differences are *adaptations*, or traits that distinguish plants of the environment. Adapted features include temperature, soil, and water.

infer, or make your best guess, about some of the abiotic factors in each of the ecosystems.

C		

Similarly, these locations are all home to many *biotope*, or living, factories as well.

What kinds of species do you think live in each of these places? Feel free to include plants, animals, birds, fish, insects, and even microorganisms like blue bacteria!

Location	Species Living There
A	

Lastly, the **chaparral** biome is a coastal biome with hot, dry summers and mild winters. It has mostly shrubs with a few short trees. Deer, birds, and rabbits live in the chaparral.

Students: When we think of deserts, we usually think of a hot and dry place. But did you know that deserts can be cold too? The Sahara Desert in Africa is the largest hot desert, but Antarctica has the largest cold desert. Antarctica is so cold that it gets no rain or snow, but it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Think about ways of surviving such a harsh, dry environment.

Timeline:

Take a look at the map below to get a feel for the position and sizes of our global economies. Remember that the largest income of all, the marine income, is not shaded on this map. You will use the information presented here to answer questions on the following pages.

1. Which land biome is the largest?
2. Which continents have this biome on them?
3. Which continent has the most different biomes?
4. What biomes does it have?

Deserts When we think of deserts, we usually think of a hot and dry place, but did you know that deserts can be cold too? The Sahara Desert in Africa is the largest hot desert, but Antarctica is the coldest desert on Earth. It's still considered a desert because it has so little rain (or snow) that it's still considered a desert. There are many different types of deserts, and each has its own unique plants and animals. Many develop unique ways of surviving, such as water storage.

Forest: Includes different kinds of forest biomes, including temperate deciduous forest, coniferous forest, tropical rain forest, and tundra. The forest biomes are the most diverse and productive of the biomes. They are also the most heavily impacted by human activity. The forest biomes are the source of many of the world's most important resources, including timber, paper, and food. The forest biomes are also home to many of the world's most important species, including many of the world's most endangered species.

Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are oceans, forests, grasslands, and deserts. Each biome is unique and therefore essential to the health of the planet. One of the most important concepts in ecology is understanding **biodiversity**, or the amazing variety of life that makes our Earth so special in comparison to other planets.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all tree-filled continents considered a forest biome? The number of biomes you split the world into simply depends on how specific you'd like to be. Let's take a look at some of the largest biomes, and the aquatic and tundra biomes that define them.

Lake

Pond

Aquatic Biomes

Approximately 70% of the Earth's surface is covered by water. The aquatic biomes, both marine and freshwater, include coastal reefs, estuaries, and open water. Marine biomes include coral reefs, kelp forests, and open ocean. Freshwater biomes include lakes, rivers, and streams. Aquatic biomes are characterized by their high biodiversity and the presence of many species of plants and animals. They also play a crucial role in the global carbon cycle and oxygen production.

Savanna

Grassland
Grassland biomes live up to their name! They're made up of grasses, and very few trees. The two major grassland biomes are the *steppe* and the *savanna*. The *savanna* is a hot biome that covers half of Africa, and large parts of Australia. These areas have a 6-8 month wet season in the summer and winter. Many animals live in savannas like elephants, zebras, and giraffes in a savanna.

Answer the following questions using the world map.

1. What is a biome?
2. Is weather a biotic factor or an abiotic factor? How do you know?

Name: _____ could find in a marine ecosystem.

What adaptations (or changes) do you think polar bears need to survive in their cold environment? What adaptations do you think camels need to survive in the desert?
