Aim:

Experiment - 2

To compare the rate of transpiration through the upper and lower surfaces of a leaf by using cobalt chloride paper.

Materials required:

A potted plant, cobalt chloride solution, filter paper, clip, desiccator, glass slides, microscope etc.

Principle:

Transpiration is loss of water in the form of vapour from the leaves and other aerial parts of the stem. About 90% of transpiration takes place through the stomata. Some amount of water is also lost through cuticular transpiration. Rate of transpiration depends upon several factors like light, temperature, wind, humidity etc. Also on the size, type, number and distribution of stomata on the leaves. It is known that the distribution and number of stomata on the two surfaces of leaf varies. In majority of plants, especially in dicotyledonous leaves, the number of stomata is more on the lower epidermis than the upper epidermis.

Rate of transpiration is determined with the help of cobalt chloride paper. This paper is blue in colour. Moisture released during transpiration can change the blue colour of cobalt chloride paper to pink. The time taken for this change of colour is proportional to rate of transpiration.

Procedure:

1. Dry filter papers in cobalt chloride solution and dry them. Keep them in a desiccator so that they are free from any moisture. In a dried state, they are blue in colour.
2. Fix two dried cobalt chloride papers one on either side of the leaf of a potted plant with the help of clip. Make them airtight and note the time.
3. Observe the time taken for these papers to turn pink from blue.

Observations:

1. Time taken to change colour from blue to pink when cobalt chloride paper is on the upper surface of the leaf = ... minutes.
2. Time taken to change from blue to pink when cobalt chloride paper is on the lower surface of the leaf = ... minutes.

Result and Discussion:

The upper surface of leaf has less number of stomata so more time will be taken for the cobalt chloride paper to change from blue to pink, while the lower surface of leaf has more number of stomata so less time will be taken for the cobalt chloride paper to change from blue to pink. This is because of the fact that the rate of transpiration is higher when the stomata are more in number and vice versa.

In this way, rate of transpiration in different plants can also be compared. Further effect of various factors such as light, temperature, wind etc. on transpiration, can also be studied.
