1. **Explain the difference between a point estimate and a confidence interval.**
A point estimate is a single value that serves as an estimate of a population parameter. A confidence interval is a range of values that is likely to contain the true value of the population parameter.
2. **Describe the Central Limit Theorem and its importance in statistics.**
The Central Limit Theorem states that the distribution of sample means will approach a normal distribution as the sample size increases, regardless of the shape of the population distribution.
3. **Define the standard error of the mean and explain how it is calculated.**
The standard error of the mean (SEM) is the standard deviation of the sampling distribution of the sample mean. It is calculated as the population standard deviation divided by the square root of the sample size.
4. **Explain the difference between a z-test and a t-test.**
A z-test is used when the population standard deviation is known and the sample size is large. A t-test is used when the population standard deviation is unknown and the sample size is small.
5. **Describe the concept of statistical significance and how it is determined.**
Statistical significance is the probability that the observed results are not due to chance. It is determined by comparing the p-value to a predetermined significance level (alpha).
6. **Explain the difference between a one-tailed test and a two-tailed test.**
A one-tailed test is used when the researcher is interested in a specific direction of effect. A two-tailed test is used when the researcher is interested in any effect, regardless of direction.
7. **Define the concept of power and explain how it is related to sample size.**
Power is the probability of correctly rejecting the null hypothesis. It is related to sample size, as larger samples generally result in higher power.
8. **Explain the difference between a confidence interval and a prediction interval.**
A confidence interval estimates the range of values for a population parameter. A prediction interval estimates the range of values for an individual observation.
9. **Describe the concept of regression analysis and its applications.**
Regression analysis is a statistical method used to model the relationship between a dependent variable and one or more independent variables.
10. **Explain the difference between a linear regression model and a logistic regression model.**
A linear regression model is used to predict a continuous outcome variable. A logistic regression model is used to predict a binary outcome variable.
11. **Define the concept of ANOVA and explain its purpose.**
ANOVA (Analysis of Variance) is a statistical method used to compare the means of three or more groups.
12. **Explain the difference between a one-way ANOVA and a two-way ANOVA.**
A one-way ANOVA compares the means of three or more groups based on a single factor. A two-way ANOVA compares the means of three or more groups based on two factors.
13. **Describe the concept of correlation and explain how it is measured.**
Correlation is a measure of the strength and direction of the relationship between two variables. It is measured using the Pearson correlation coefficient.
14. **Explain the difference between a positive correlation and a negative correlation.**
A positive correlation indicates that as one variable increases, the other variable also tends to increase. A negative correlation indicates that as one variable increases, the other variable tends to decrease.
15. **Define the concept of causation and explain how it differs from correlation.**
Causation is a relationship between two variables where one variable is the cause of the other. Correlation is a relationship between two variables where they tend to move together, but one does not necessarily cause the other.
