Autonomous Learning Systems Plamen P. Angelov, 2013-01-01 *Autonomous Learning Systems* Plamen Angelov, 2012-11-06

Autonomous Learning Systems is the result of over a decade of focused research and studies in this emerging area which spans a number of well known and well established disciplines that include machine learning system identification data mining fuzzy logic neural networks neuro fuzzy systems control theory and pattern recognition The evolution of these systems has been both industry driven with an increasing demand from sectors such as defence and security aerospace and advanced process industries bio medicine and intelligent transportation as well as research driven there is a strong trend of innovation of all of the above well established research disciplines that is linked to their on line and real time application their adaptability and flexibility Providing an introduction to the key technologies detailed technical explanations of the methodology and an illustration of the practical relevance of the approach with a wide range of applications this book addresses the challenges of autonomous learning systems with a systematic approach that lays the foundations for a fast growing area of research that will underpin a range of technological applications vital to both industry and society Key features Presents the subject systematically from explaining the fundamentals to illustrating the proposed approach with numerous applications Covers a wide range of applications in fields including unmanned vehicles robotics oil refineries chemical industry evolving user behaviour and activity recognition Reviews traditional fields including clustering classification control fault detection and anomaly detection filtering and estimation through the prism of evolving and autonomously learning mechanisms Accompanied by a website hosting additional material including the software toolbox and lecture notes *Autonomous Learning Systems* provides a one stop shop on the subject for academics students researchers and practicing engineers It is also a valuable reference for Government agencies and software developers Computational Intelligence - Volume I Hisao Ishibuchi, 2015-12-30 Computational intelligence is a component of Encyclopedia of Technology Information and Systems Management Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Computational intelligence is a rapidly growing research field including a wide variety of problem solving techniques inspired by nature Traditionally computational intelligence consists of three major research areas Neural Networks Fuzzy Systems and Evolutionary Computation Neural networks are mathematical models inspired by brains Neural networks have massively parallel network structures with many neurons and weighted connections Whereas each neuron has a simple input output relation a neural network with many neurons can realize a highly non linear complicated mapping Connection weights between neurons can be adjusted in an automated manner by a learning algorithm to realize a non linear mapping required in a particular application task Fuzzy systems are mathematical models proposed to handle inherent fuzziness in natural language For example it is very difficult to mathematically define the meaning of cold in everyday conversations such as It is cold today and Can I have cold water The meaning of cold may be

different in a different situation Even in the same situation a different person may have a different meaning Fuzzy systems offer a mathematical mechanism to handle inherent fuzziness in natural language As a result fuzzy systems have been successfully applied to real world problems by extracting linguistic knowledge from human experts in the form of fuzzy IF THEN rules Evolutionary computation includes various population based search algorithms inspired by evolution in nature Those algorithms usually have the following three mechanisms fitness evaluation to measure the quality of each solution selection to choose good solutions from the current population and variation operators to generate offspring from parents Evolutionary computation has high applicability to a wide range of optimization problems with different characteristics since it does not need any explicit mathematical formulations of objective functions For example simulation based fitness evaluation is often used in evolutionary design Subjective fitness evaluation by a human user is also often used in evolutionary art and music These volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers
