Arc Routing Arc Routing:

Arc Routing Angel Corberan, Gilbert Laporte, 2014-12-01 This book provides a thorough and up to date discussion of arc routing by world renowned researchers Organized by problem type the book offers a rigorous treatment of complexity issues models algorithms and applications **Arc Routing Problems Methods and Applications** opens with a historical perspective of the field and is followed by three sections that cover complexity and the Chinese Postman and the Rural Postman problems the Capacitated Arc Routing Problem and routing problems with min max and profit maximization objectives and important applications including meter reading snow removal and waste collection

Arc Routing Moshe Dror, 2000-08-31 **Arc Routing Theory Solutions and Applications** is about arc traversal and the wide variety of arc routing problems which has had its foundations in the modern graph theory work of Leonhard Euler Arc routing methods and computation has become a fundamental optimization concept in operations research and has numerous applications in transportation

telecommunications manufacturing the Internet and many other areas of modern life The book draws from a variety of sources including the traveling salesman problem TSP and graph theory which are used and studied by operations research engineers computer scientists and mathematicians In the last ten years or so there has been extensive coverage of arc routing problems in the research literature especially from a graph theory perspective however the field has not had the benefit of a uniform systematic treatment With this book there is now a single volume that focuses on state of the art exposition of arc routing problems that explores its graph theoretical foundations and that presents a number of solution methodologies in a variety of application settings Moshe Dror has succeeded in working with an elite group of ARC routing scholars to develop the highest quality treatment of the current state of the art in arc routing

A Time Buffered Arc Routing Problem Kurt Jame Ehlers, 2015 Arc routing problems are prevalent in our world today They are important to society and businesses on a daily basis The purpose of this work is to consider a problem that has not been addressed in the literature That problem is how to find the maximal weighted tour of an undirected set of arcs that visits all of the edges within some time constraint and no edge twice within some time buffer This problem similar to most arc and vehicle routing problems is known to be NP hard and thus can only be solved optimally for the most simplistic problems Furthermore being a mixed integer nonlinear program most solvers may not be able to guarantee a solution is optimal for even small problem instances To be able to address realistic problem sets with a large number of vertices a comparative route building heuristic was developed to find a near optimal tour This heuristic the mixed integer nonlinear program solver and a hand solution were all compared for a relatively simple four node network problem The program for the mixed integer nonlinear solver could not solve the problem optimally A hand solution found for the network was used to show the formulation s accuracy through the solver program and was checked for general optimality by the solver A heuristic was built that was able to find this optimal solution It is assumed that the heuristic is scalable and hence will also provide a near optimal solution for higher

complexity problem instances with a larger number of nodes and arcs *On Arc-routing Problems* Claudia Bode,2013

Controlling Turn Penalties in Arc Routing Problems Jacinthe Clossey,1999 In arc routing problems it is necessary to determine a least cost traversal of some arcs of edges of a graph Applications of these problems are encountered in such areas as mail delivery snow removal street cleaning and garbage collection In some problems the cost of a route is not only determined by its length or driving time but also by the types of turns made at intersections for example left turns are usually more complex and more costly than right turns It therefore makes sense to assign a cost to each type of turn and account for it in the model solution process Traditionally turn penalties in arc routing problems are taken into account through a transformation of the problem in to an equivalent node routing problem This paper presents a more directed approach not resorting to such a transformation The approach involves transforming the graph into an Eulerian graph and then applying an end pairing algorithm Six strategies using the approach are described and tested and computational results are compared

New Models and Algorithms for Several Families of Arc Routing Problems Jessica Rodríguez Pereira,2018 Some of the most common decisions to be taken within a logistic systems at an operational level are related to the design of the vehicle routes Vehicle Routing Problems and Arc Routing Problems are well known families of problems addressing such decisions Their main difference is whether service demand is located at the vertices or the edges of the operating network In this thesis we focus on the study of several arc routing problems We concentrate on three families of problems The first family consists of Multi Depot Rural Postman Problems which are an extension of Rural Postman Problems where there are several depots instead of only one The second family of problems that we study are Location Arc Routing Problems in which the depots are not fixed in advance so their location becomes part of the decisions of the problem We finally study Target Visitation Arc Routing Problems where the service is subject to an ordering preference among the connected components induced by demand arcs Different models are studied for each considered family In particular two different Multi Depot Rural Postman Problem models are considered which differ in the objective function the minimization of the overall transportation cost or the minimization of the makespan Concerning Location Arc Routing Problems we study six alternative models that differ from each other in their objective function whether there is an upper bound on the number of facilities to be located or whether there are capacity constraints on the demand that can be served from selected facilities Finally two Target Visitation Arc Routing Problem models are studied which differ from each other in whether or not it is required that all the required edges in the same component are visited consecutively The aim in this thesis is to provide quantitative tools to the decision makers to identify the best choices for the design of the routes To this end and for each considered problem we first study and analyze its characteristics and properties Based on them we develop different Integer Linear Programming formulations suitable for being solved through branch and cut Finally all formulations are tested through extensive computational experience In this sense for Multi Depot Rural Postman Problems and Location Arc Routing Problems we

propose natural modeling formulations with three index variables where variables are associated with edges and facilities For some of the models we also present alternative formulations with only two index variables which are solely associated with edges Finally for the Target Visitation Arc Routing Problems we propose three different formulations two alternative formulations for the general case and one for the clustered version where all the edges in the same components are served sequentially which exploits some optimality conditions of the problem

Arc-Routing Models for Small Package Local Routing Si Chen, Bruce Golden, Richard Wong, Hongsheng Zhong, 2013 This paper studies the arc routing problem that arises in small package delivery In practice each service provider is encouraged to follow a master route a predesigned sequence of street addresses over an extended planning horizon more than one day The objective here is to construct efficient master routes The focus on arc routing offers two advantages First real world vehicle routing takes place over a street network rather than in Euclidean space Second there are typically many fewer streets than customer locations Currently a deterministic arc routing problem DARP model is used to solve the problem However this approach ignores the uncertainty in the street segment presence probability the probability that a street segment requires i e there is a demand for a visit on a particular day We introduce two new models namely the probabilistic arc routing problem PARP model and the multiday arc routing problem MARP model which take into account the street segment presence probabilities PARP attempts to minimize the expected length of the master route It assumes that the street segment presence probabilities are independent This model can require excessive amounts of computation time On the other hand MARP tries to minimize average length of the master route over prespecified days This model can also be viewed as a Monte Carlo simulation approximation of the PARP This approximation significantly reduces the computational burden Additionally by utilizing historical data MARP incorporates real world correlations among the street segment presence probabilities Our computational results show that PARP and MARP may produce more efficient master routes than DARP by taking demand uncertainty into account

Solving the Close-enough Arc Routing Problem, 2012 *A Historical Perspective on Arc Routing* Horst A. Eiselt, Gilbert Laporte, 1998 Arc routing problems consist of determining a least cost traversal of some arcs or edges of a graph subject to side constraints Such problems are encountered in a variety of practical situations such as road maintenance garbage collection mail delivery and bus routing This paper presents a historical review of the field of arc routing from the solving of the Konigsberg Bridge problem by Euler in 1736 The review is organized around three main problem classes the Chinese postman problem the rural postman problem and the capacitated arc routing problem
