

b. Two Tier systems/ Two Tier Architecture

A two-tier system consists of a client and a server. The database is stored on the server, and application used to access the database is installed on the client.

The advantages of Two-Tier systems are as follows:

- The system performance is higher because business logic and database are physically close.
- Since processing is shared between the client and server, more users could interact with system.
- By having simple structure, it is easy to setup and maintain entire system smoothly.

The disadvantages of Two-Tier systems are as follows:

- Performance deteriorates if number of users is greater than 100.
- There is restricted flexibility and choice of DBMS.

c. Three Tier Architecture

Three-tier architecture is a client-server architecture in which the functional process logic, data access, computer data storage and user interface are developed and maintained as independent modules on separate platforms.

The three tiers in three-tier architecture are as follows:

- Presentation Tier:** This tier communicates with other tiers by sending data to other tiers in the network.
- Application Tier:** It controls application functionality by performing detailed processing.
