Study Guide for Chemical Principles Thomas Elliott Taylor, 1979

Numerical study of physico- chemical interactions for CO₂ sequestration and geothermal energy utilization in the Ordos Basin, China Hejuan Liu, 2014-11-10 In this dissertation three simulators i e TOUGH2MP TOUGHREACT and FLAC3D were used to simulate the complex physical and chemical interactions induced by CO₂ sequestration The simulations were done instages ranging from the two phase water and CO₂ fluid flow H₂ through coupled

hydro mechanical effects H2M and geochemical responses i e CO2 water rock interactions H2C to the extension of CCS to CCUS by the application of combined geothermal production and CO2 sequestration technologies The findings of this study are essential for a thorough understanding of the complex interactions in the multiphase multicomponent porous media controlled by different physical and chemical mechanisms Furthermore the simulation results will provide an invaluable reference for field operations in CCS projects especially for the full integration pilot scale CCS project launched in the Ordos Basin Subsequently a preliminary site selection scheme for the combined geothermal production and CO2 sequestration was set up which considered various factorsinvolved in site selection ranging from safety economical environmental and technical issues This work provides an important framework for the combined geothermal production and CO2 sequestration project However further numerical and field studies are still needed to improve on a series of criteria and related parameters necessary for a better understanding of the technology
