

RADIOACTIVE DECAY

Radioactive Decay of Candium 150

Introduction: Some isotopes spontaneously emit particles or energy for stable or unstable elements. The unstable radioactive decays. This decay occurs naturally and is not affected by chemical change, temperature, or pressure.

Radioactive decay takes place if a nucleus is unstable. Although you cannot predict just when a given atom will decay, you can predict that all atoms of a given isotope will decay.

Radioactive element, is given number will decay at a predictable and predictable rate.

Half-life of radioactive element is the time taken for half of the substance to decay. Comparing the percentage of original element present at any time to the percentage of the element present at the start, the age of which can be calculated. The ratio of the two is a direct function of time because when the half-life is known, it must be present atoms of daughter atoms.

Procedure:

- 1. Radioactive element
- 2. Half-life
- 3. Radioactive decay
- 4. Radioactive dating

4. Count and record the number of undecayed "undecayed" Candium atoms (M) and the remaining.

a. Record in the data table.

Repeat steps 2, 3 and 4 until all the radioactive "undecayed" (Parent M) atoms decay or 10 minutes or the time whichever happens first.

Half-life (M)	Parent atoms (M)	Daughter atoms (D)
