## Animal Reproduction

### KEY CONCEPTS

- 46.1** Both asexual and sexual reproduction occur in the animal kingdom.
- 46.2** Fertilization depends on mechanisms that bring together sperm and eggs of the same species.
- 46.3** Reproductive organs produce and transport gametes.
- 46.4** The interplay of tropic and sex hormones regulates mammalian reproduction.
- 46.5** In placental mammals, an embryo develops fully within the mother's uterus.

**▲ Figure 46.1** How can each of these sea slugs be both male and female?

### Pairing Up for Sexual Reproduction

The sea slugs, or nudibranchs (*Nembrotha chamberlaini*), in **Figure 46.1** are mating. If not disturbed, these marine molluscs may remain joined for hours. Sperm will be transferred and will fertilize eggs. A few weeks later, sexual reproduction will be complete. New individuals will hatch, but which parent is the mother? The answer is simple yet probably unexpected: both. In fact, each sea slug produces eggs *and* sperm.

As humans, we tend to think of reproduction in terms of the mating of males and females and the fusion of sperm and eggs. Animal reproduction, however, takes many forms. In some species, individuals change their sex during their lifetime; in other species, such as sea slugs, an individual is both male and female. There are animals that can fertilize their own eggs, as well as others that can reproduce without any form of sex. For certain species, such as honeybees, only a few individuals within a large population reproduce.

A population outlives its members only by reproduction, the generation of new individuals from existing ones. In this chapter, we'll compare the diverse reproductive mechanisms that have evolved among animals. We'll then examine details of mammalian reproduction, with emphasis on the well-studied example of humans. We'll focus on reproduction mostly from the parents' perspective, deferring the details of embryonic development until the next chapter.
