Abstract: *Chrysomelids* are a group of beetles in the order Coleoptera. In addition to a wide variety of agricultural pests, some species are beneficial. *Chrysomelids* are found in all parts of the world, and are most abundant in temperate regions. They are found in a wide variety of habitats, including forests, grasslands, and agricultural fields. They are most commonly found on plants, where they feed on leaves, stems, and roots. Some species are highly specialized, feeding on a single plant species, while others are generalists, feeding on a wide variety of plants. *Chrysomelids* are also found on rocks, where they feed on algae and lichens. They are most active during the summer months, and are most abundant in areas with high humidity and rainfall.
