

The background of the book cover is a detailed topographic map. It features a prominent mountain range with a large volcano on the right side, which is emitting a thick plume of white smoke or ash. The terrain is depicted with various shades of brown, tan, and red, indicating different elevations and geological features. A network of roads or trails is visible, with some highlighted in red. The overall style is that of a classic topographic map.

Expert Systems Research Trends A.

R. Tyler, 2007 An expert system also known as a knowledge based system is a computer program that contains some of the subject specific knowledge of one or more human experts This class of program was first developed by researchers in artificial intelligence during the 1960s and 1970s and applied commercially throughout the 1980s The most common form of expert systems is a program made up of a set of rules that analyse information usually supplied by the user of the system about a specific class of problems as well as providing mathematical analysis of the problem s and depending upon their design recommend a course of user action in order to implement corrections It is a system that utilises what appear to be reasoning capabilities to reach conclusions This book presents important research on in this dynamic field

Artificial Intelligence Perspective for Smart Cities Vahap Tecim, Sezer Bozkus Kahyaoglu, 2022-11-23 The concept of a smart city is used widely in general however it is hard to explain because of the complexity and multidimensionality of this notion However the essential qualification for being a smart city is to achieve sustainable social environmental and economic development and boost the living standards of society based on Information and Communication Technology ICT and Artificial intelligence AI AI in smart cities has become an important aspect for cities that face great challenges to make smart decisions for social well being particularly cybersecurity and corporate sustainability In this context we aim to contribute literature with a value added approach where various AI applications of smart cities are discussed from a different perspective First we start by discussing the conceptual design modeling and determination of components for the sustainability of a smart city structure Since smart cities operate on spatial based data it is important to design operate and manage smart city elements using Geographical Information Systems GIS technologies Second we define the structure type unit and functionality of the layers to be placed on the GIS to achieve best practices based on Industry 4 0 components Transportation is one of the key indicators of smart cities so it is critical to make transportation in smart cities accessible for different disabled groups by using AI technologies Third we demonstrate what kinds of technologies should be used for which disabled groups in different transportation vehicles with specific examples Finally we create a discussion platform for processes and sub processes such as waste management emergency management and data management for establishing smart cities including the financial and ethical aspects

Geographic Data Science with R Michael C. Wimberly, 2023-05-08 The burgeoning field of data science has provided a wealth of techniques for analysing large and complex geospatial datasets including descriptive explanatory and predictive analytics However applying these methods is just one part of the overall process of geographic data science Other critical steps include screening for suspect data values handling missing data harmonizing data from multiple sources summarizing the data and visualizing data and analysis results Although there are many books available on statistical and machine learning methods few encompass the broader topic of scientific workflows for geospatial data processing and analysis The purpose of Geographic Data Science with R is to fill this gap by providing a series of tutorials aimed at teaching good practices for using geospatial data to address problems in

environmental geography It is based on the R language and environment which currently provides the best option for working with diverse spatial and non spatial data in a single platform Fundamental techniques for processing and visualizing tabular vector and raster data are introduced through a series of practical examples followed by case studies that combine multiple types of data to address more complex problems The book will have a broad audience Both students and professionals can use it as a workbook to learn high level techniques for geospatial data processing and analysis with R It is also suitable as a textbook Although not intended to provide a comprehensive introduction to R it is designed to be accessible to readers who have at least some knowledge of coding but little to no experience with R Key Features Focus on developing practical workflows for processing and integrating multiple sources of geospatial data in R Example based approach that teaches R programming and data science concepts through real world applications related to climate land cover and land use and natural hazards Consistent use of tidyverse packages for tabular data manipulation and visualization Strong focus on analysing continuous and categorical raster datasets using the new terra package Organized so that each chapter builds on the topics and techniques covered in the preceding chapters Can be used for self study or as the textbook for a geospatial science course
