Atlas of the Cellular and Molecular Development of Human Hematopoiesis Christof Dame, Theodor M. Fließner, Martha Sola-Visner, Mervin C. Yoder, 2025-06-02 This is the first atlas dedicated to illustrating the cellular and molecular mechanisms that underlie the unique features of human hematopoiesis during embryonic fetal and neonatal developments This state of the art atlas is published more than thirty years after the legendary Atlas of Human Hemopoietic Development by Kelemen Calvo and Fließner After presenting the principles of developmental hematopoiesis the atlas focuses on lineage specific processes The unique material of the previous atlas by Kelemen et al is used to illustrate the histologic features of human embryonic and fetal hematopoiesis Findings from animal studies are included to provide an up to date description of cellular and molecular mechanisms Including approx 300 full color figures Plus DVD with additional material Molecular mechanisms are schematically depicted in figures or line drawings presented side by side to the referred microscopies Together these present a clear graphic depiction of the changes that occur during the normal development of the human hematopoietic system and their implications to hematologic disorders with onset during fetal life or infancy Of particular interest to clinicians Molecular and clinical aspects of the most frequent hematologic disorders in fetuses and neonates Reference values for different hematological parameters during fetal and neonatal development This atlas provides a unique source of information for clinicians and researchers working in the fields of developmental biology fetal medicine perinatal medicine neonatology pediatrics and hematology Harnessing the Complexity of Normal and Pathological Hematopoietic Supportive

Hematopoiesis
Leonard I. Zon, 2001-04-12 Hematopoiesis or the process of blood formation has been extensively studied at both basic and clinical levels Human diseases such as thalassemia immunodeficiency and leukemia represent defects in this process Approaches to treat these disorders have required a basic understanding of the biology of blood cells For instance hemapoietic stem cell replacement or bone marrow transplantation has been used to ameliorate disease This volume focuses on hematopoiesis at a cellular and molecular level and establishes the basis for clinical manipulation of hematopoietic cells for therapeutic benefit In Part I the cellular characteristics of progenitors and stem cells are explored Emphasis is placed on purification of stem cells and both in vitro and in vivo assays The regulation of normal and leukemias stem cells is illustrated An excellent discussion of potential use of these cells for gene therapy concludes this section Hemapoiesis is easily studied during embryogenesis Part II develops the concept of the waves of hemapoiesis during development Comparative hematology is making a major comeback as a field in the 1990 s One hope is that general principles of hematopoiesis will be established by studying many models and systems Part III delves into critical factors that regulate hematopoiesis including both intracellular and extracellular signals Part IV and V describe lineage programs for myeloid and lymphoid lineages These chapters are meant to be illustrative of the different cell fates but are not exhaustive Part VI examines the genetics of hematopoisis particularly in animal models The hematopoietic system is in constant contact with stromal cells and endothelial cells during development and in the adult Evidence suggests that endothelial cells and blood cells may arise from a common progenitor the hemangioblast Part VII and VIII discuss the stromal and endothelial cells with the emphasis on their interaction with hematopoietic cells
