For common structures, their life assessment is not only governed by the theory of fracture mechanics and fatigue damage process but by other factors such as corrosion, grounding and sudden collision. On the other hand, SHM deals with the detection, prediction and location of crack development online. Both SLA and SHM are combined in a unified and coherent treatment.

Design Process Improvement John Clarkson, Claudia

Eckert, 2010-03-26 vi The process is important. I learned this lesson the hard way during my previous existence working as a design engineer with PA Consulting Group's Cambridge Technology Centre. One of my earliest assignments involved the development of a piece of laboratory automation equipment for a major European pharmaceutical manufacturer. Two things stick in my mind from those early days: first, that the equipment was always to be ready for delivery in three weeks and second, that being able to write well-structured Pascal was not sufficient to deliver reliable software performance. Delivery was ultimately six months late, the project ran some sixty percent over budget and I gained my first promotion to Senior Engineer. At the time, it puzzled me that I had been unable to predict the real effort required to complete the automation project. I had, Reader in Engineering Design, genuinely believed that the project would be finished in three weeks. It was some years later that I discovered Kenneth Cooper's Design Centre papers describing the Rework Cycle and realised that I had been the victim of undiscovered rework. I quickly learned that project plans were not just inaccurate as most project managers would attest but often grossly misleading, bearing little resemblance to actual development practice.
