Advanced Biosignal Processing Advanced Biosignal Processing:

Advanced Biosignal Processing Amine Nait-Ali, 2009-04-21 Generally speaking Biosignals refer to signals recorded from the human body They can be either electrical e g Electrocardiogram ECG Electroencephalogram EEG Electromyogram EMG etc or non electrical e g breathing movements etc The acquisition and processing of such signals play an important role in clinical routines They are usually considered as major indicators which provide clinicians and physicians with useful information during diagnostic and monitoring processes In some applications the purpose is not necessarily medical It may also be industrial For instance a real time EEG system analysis can be used to control and analyze the vigilance of a car driver In this case the purpose of such a system basically consists of preventing crash risks Furthermore in certain other applications a set of biosignals e g ECG respiratory signal EEG etc can be used to control or analyze human emotions This is the case of the famous polygraph system also known as the lie detector the efficiency of which remains open to debate Thus when one is dealing with biosignals special attention must be given to their acquisition their analysis and their processing capabilities which constitute the final stage preceding the clinical diagnosis Naturally the diagnosis is based on the information provided by the processing system

Advanced Biosignal Processing and Diagnostic Methods Christoph Hintermüller, 2016-07-21 Personal health and well being was and is important for all individuals This includes the way people are living what they do to stay healthy as well as a profound well informed diagnosis and appropriate treatment in case of disease To achieve these goals modern medicine is provided with a large variety of tools to assess a patient's health state and collect the information required for a proper diagnosis and treatment which is tailored to the patient's needs Many of these available tools use signals either generated by the human body for example electroencephalogram EEG and electrocardiogram ECG or by interacting with the human body while traversing it like microwaves or reflected visible light that is recorded by a video camera The biosignals recorded by the available and newly developed methods have to be processed to extract the information about the patient's condition and analyzed tissue and cells This book presents a small selection of the recent developments in the field of biosignal processing The covered diagnostic tools and methods include the assessment of respiratory state through gait analysis the contactless monitoring of cardiovascular and respiratory parameters using microwaves a non linear approach to extract the fetal ECG from non invasive abdominal recordings identification of epileptic networks from pre surgical neurophysiological recordings and an improved method to obtain and validate the copy number alterations parameter which are considered an important marker in cancer classification
