An Introduction to Numerical Methods Using MATLAB K. Akbar Ansari, Bonni Dichone, 2019 An Introduction to Numerical Methods using MATLAB is designed to be used in any introductory level numerical methods course It provides excellent coverage of numerical methods while simultaneously demonstrating the general applicability of MATLAB to problem solving This textbook also provides a reliable source of reference material to practicing engineers scientists and students in other junior and senior level courses where MATLAB can be effectively utilized as a software tool in problem solving The principal goal of this book is to furnish the background needed to generate numerical solutions to a variety of problems Specific applications involving root finding interpolation curve fitting matrices derivatives integrals and differential equations are discussed and the broad applicability of MATLAB demonstrated This book employs MATLAB as the software and programming environment and provides the user with powerful tools in the solution of numerical problems Although this book is not meant to be an exhaustive treatise on MATLAB MATLAB solutions to problems are systematically developed and

included throughout the book MATLAB files and scripts are generated and examples showing the applicability and use of MATLAB are presented throughout the book Wherever appropriate the use of MATLAB functions offering shortcuts and alternatives to otherwise long and tedious numerical solutions is also demonstrated At the end of every chapter a set of problems is included covering the material presented A solutions manual to these exercises is available to instructors

Model Predictive Vibration Control Gergely Takács, Boris Rohal-Ilkiv, 2012-03-14 Real time model predictive controller MPC implementation in active vibration control AVC is often rendered difficult by fast sampling speeds and extensive actuator deformation asymmetry If the control of lightly damped mechanical structures is assumed the region of attraction containing the set of allowable initial conditions requires a large prediction horizon making the already computationally demanding on line process even more complex Model Predictive Vibration Control provides insight into the predictive control of lightly damped vibrating structures by exploring computationally efficient algorithms which are capable of low frequency vibration control with guaranteed stability and constraint feasibility In addition to a theoretical primer on active vibration damping and model predictive control Model Predictive Vibration Control provides a guide through the necessary steps in understanding the founding ideas of predictive control applied in AVC such as the implementation of computationally efficient algorithms control strategies in simulation and experiment and typical hardware requirements for piezoceramics actuated smart structures The use of a simple laboratory model and inclusion of over 170 illustrations provides readers with clear and methodical explanations making Model Predictive Vibration Control the ideal support material for graduates researchers and industrial practitioners with an interest in efficient predictive control to be utilized in active vibration attenuation Applied Numerical Methods with MATLAB for Engineers and Scientists Steven C.
