## Biome Assessment Study Guide

**Biomes:** A place characterized by the organisms that live there and determined by the abiotic factors of rainfall and temperature.

A biome can be aquatic (water) or terrestrial (land) and contain one or more ecosystems.

### Land Biomes

**Temperate deciduous forest-** soil is fairly rich and plants cover the forest floor

- most trees are deciduous, losing their leaves in the fall to help conserve water so they can survive winter.

**Coniferous/Taiga forest-** conifer trees that produce their seeds in cones and do not lose their leaves in fall

- trees conserve water in the winter with the help of needlelike leaves and a waxy coating on their leaves

**Tropical rainforests** - receive the highest yearly average rainfall

- most biologically diverse (the most different types of plants and animals)
- soil is wet and has poor nutrients

**Savanna-** large herbivores live and graze on the grass here, scattered clumps of trees

**Temperate grasslands** have small, wind-swept, scattered trees

**Desert** - little water, low rainfall, vegetation that stores water

**Tundra** - no trees, dominated by low-growing plants that store water in their stems
