Applied Bioremediation And Phytoremediation Soil Biology:

Applied Bioremediation and Phytoremediation Ajay Singh, Owen P. Ward, 2013-06-29 The huge expansion of the chemical and petroleum industries in the twentieth century has resulted in the production of a vast array of chemical compounds and materials that have transformed our lives. The associated large scale manufacturing processing and handling activities have caused a serious deterioration in environmental quality and created threats to human health. These negative impacts have led to responses and regulations requiring remedial action in support of environmental sustainability of biotechnological methods through bioremediation. Application has gained prominence as an option for soil remediation methods. Bioremediation is a multidisciplinary approach where biologists, chemists, soil scientists and engineers work as a team to develop and implement remediation processes. Bioremediation has now been used successfully to remediate many petroleum contaminated sites. However, there are as yet no commercial technologies commonly used to remediate the most recalcitrant contaminants. Nevertheless, bioremediation is a rapidly advancing field and new bio-based remedial technologies are continuing to emerge. **Advances in Applied Bioremediation** Ajay Singh, Ramesh C. Kuhad, Owen P.

Ward, 2009-07-30 Bioremediation is a rapidly advancing field and the technology has been applied successfully to remediate many contaminated sites. The goal of every soil remediation method is to enhance the degradation, transformation or detoxification of pollutants and to protect, maintain and sustain environmental quality. Advances in our understanding of the ecology of microbial communities capable of breaking down various pollutants and the molecular and biochemical mechanisms by which biodegradation occurs have helped us in developing practical soil bioremediation strategies. Chapters dealing with the application of biological methods to soil remediation are contributed from experts/authorities in the area of environmental science including microbiology and molecular biology from academic institutions and industry.

Assessment and Remediation of Contaminated

Sediments Danny Reible,Tomas Lanczos,2007-01-21 Contaminated sediments pose some of the most difficult site remediation issues Contaminated sediments typically reside in spatially variable and dynamic systems subject to seasonal flow variations and episodic storm events The volume of sediments that must be managed at particular sites often exceeds one million cubic meters dwarfing many contaminated soil sites These sediments are also associated with equally daunting volumes of water and efforts to remove the contamination typically entrains even more water The environmental security of both NATO and partner countries is at risk due to the pervasive nature of sediment contamination of rivers lakes and harbors A NATO Advanced Research Workshop was convened in Bratislava in May 2005 to discuss current approaches to managing contaminated sediments and to identify research necessary to overcome outstanding problems In this text drawn from presentations and discussion of that workshop current approaches to the assessment and remediation of contaminated sediments will be discussed with the emphasis on in situ management Physical chemical and biological approaches for the assessment and remediation of sediments are all addressed Developing regulatory and strategic approaches are highlighted with a special emphasis on the potential for biological remediation for the management of contaminated sediments
