

Protein Functions:

- **Structure**: such as tubules, actins and microtubules
- **Sensors**: Initiate change inside of the cell by relaying information.
- **Enzymes**: can metabolize chemical reactions
- **Regulation**: Proteins can be activators or silencers for genes which allows gene expression to be controlled. They can also modify the function of other proteins and turn them on or off.
- **Signaling**: Proteins act as signals as well as the receptors for communication between cells. They are also the transduction pathways that interpret those signals.

Protein Structures:

- 1) Primary structure:
 - The linear array of amino acids.
 - There is an **amino end (N-terminus)** and a **carboxyl end (C-terminus)**.
 - Between each amino acid residue is a peptide bond holding it together into a chain
 - The peptide bond is between a C-terminus and an N-terminus, it is a C-N bond

Proteins are composed of amino acids

- amino acids are attached in a **linear array** to create the **primary structure** of the protein = a **polypeptide**

- 20 different amino acids are incorporated into newly synthesized polypeptide

Amino Acids:

- Each amino acid has a similar structure around the central **Alpha carbon**.
- They all consist of:
 - 1) Hydrogen
 - 2) Amino group (H_2N^+)
 - 3) Carboxyl group
 - 4) Variable R-group
- The **variable group of each individual amino acid will dictate that amino acid's properties BUT the accumulated R groups will define the properties of the entire polypeptide.**

What is an amino acid?

variable R group
(or side chain)

It is the properties of the side chains (R) that affect protein structure and function

Amino Acid Side Chains:

- The side chains of amino acids will dictate their characteristics and will change how the amino acid is classified.
- These side chains differ in:
