Applying Cognitive Science to Education Frederick Reif, 2008 An accessible introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains such as mathematics physics chemistry engineering or expository writing with practical educational applications and implementation methods Many students find it difficult to learn the kind of knowledge and thinking required by college or high school courses in mathematics science or other complex domains Thus they often emerge with significant

misconceptions fragmented knowledge and inadequate problem solving skills Most instructors or textbook authors approach their teaching efforts with a good knowledge of their field of expertise but little awareness of the underlying thought processes and kinds of knowledge required for learning in scientific domains In this book Frederick Reif presents an accessible coherent introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains such as mathematics science physics chemistry biology engineering or expository writing Reif whose experience teaching physics at the University of California led him to explore the relevance of cognitive science to education examines with some care the kinds of knowledge and thought processes needed for good performance discusses the difficulties faced by students trying to deal with unfamiliar scientific domains describes some explicit teaching methods that can help students learn the requisite knowledge and thinking skills and indicates how such methods can be implemented by instructors or textbook authors Writing from a practically applied rather than predominantly theoretical perspective Reif shows how findings from recent research in cognitive science can be applied to education He discusses cognitive issues related to the kind of knowledge and thinking skills that are needed for science or mathematics courses in high school or colleges and that are essential prerequisites for more advanced intellectual performance In particular he argues that a better understanding of the underlying cognitive mechanisms should help to achieve a more scientific approach to science education

Thinking Physics for Teaching C. Bernardini, C. Tarsitani, M. Vicentini, 2012-12-06 The research in Physics Education has to do with the search of solutions to the complex problem of how to improve the learning and teaching of physics The complexity of the problem lies in the different fields of knowledge that need to be considered in the research In fact besides the disciplinary knowledge in physics which must be considered from the conceptual the historical and the epistemological framework one has to take into account some basic knowledge in the context of psychology and the cognitive sciences for the general and contextual aspects of learning and some basic knowledge in education and communication for what concerns teaching skills and strategies Looking back at the historical development of the research one may recognize that the complexity of the endeavour was not clear at first but became clear in its development which shifted the focus of the research in the course of time from physics to learning to teaching We may say that the research started more than 30 years ago with a focus on disciplinary knowledge Physicists in different parts of the western world after research work in some field of physics decided to concentrate on the didactical communication of physical knowledge
