Food Composition and Analysis Leonard W. Aurand, 2013-11-11 There is an increasing demand for food technologists who are not only familiar with the practical aspects of food processing and merchandising but who are also well grounded in chemistry as it relates to the food industry. Thus in the training of food technologists there is a need for a textbook that combines both lecture material and laboratory experiments involving the major classes of foodstuffs and food additives. To meet this need this book was written. In addition the book is a reference text for those engaged in research and technical work in the various segments of the food industry. The chemistry of representative classes of foodstuffs is considered with respect to food composition effects of processing on composition food deterioration food preservation and food additives. Standards of identity for a number of the food products as prescribed by law are given. The food products selected from each class of foodstuffs for laboratory experimentation are not necessarily the most important economically or the most widely used. However the experimental methods and techniques utilized are applicable to the other products of that class of foodstuff. Typical food adjuncts and additives are discussed in relation to their use in food products together with the laws regulating their usage. Laboratory experiments are given for the qualitative identification and quantitative estimation of many of these substances.
