Techniques based on the method of modal expansions the Rayleigh Stevenson expansion in inverse powers of the wavelength and also the method of moments solution of integral equations are essentially restricted to the analysis of electromagnetic radiating structures which are small in terms of the wavelength It therefore becomes necessary to employ approximations based on high frequency techniques for performing an efficient analysis of electromagnetic radiating systems that are large in terms of the wavelength One of the most versatile and useful high frequency techniques is the geometrical theory of diffraction GTD which was developed around 1951 by J B Keller 1 2 3 A class of diffracted rays are introduced systematically in the GTD via a generalization of the concepts of classical geometrical optics GO According to the GTD these diffracted rays exist in addition to the usual incident reflected and transmitted rays of GO The diffracted rays in the GTD originate from certain localized regions on the surface of a radiating structure such as at discontinuities in the geometrical and electrical properties of a surface and at points of grazing incidence on a smooth convex surface as illustrated in Fig 1 In particular the diffracted rays can enter into the GO shadow as well as the lit regions Consequently the diffracted rays entirely account for the fields in the shadow region where the GO rays cannot exist *Electrodynamics: The Field-Free Approach* Kjell Prytz, 2015-03-19

This book is intended as an undergraduate textbook in electrodynamics at basic or advanced level The objective is to attain a general understanding of the electrodynamic theory and its basic experiments and phenomena in order to form a foundation for further studies in the engineering sciences as well as in modern quantum physics The outline of the book is obtained from the following principles Base the theory on the concept of force and mutual interaction Connect the theory to experiments and observations accessible to the student Treat the electric magnetic and inductive phenomena cohesively with respect to force energy dipoles and material Present electrodynamics using the same principles as in the preceding mechanics course Aim at explaining that theory of relativity is based on the magnetic effect Introduce field theory after the basic phenomena have been explored in terms of force Although electrodynamics is described in this book from its 1st principles prior knowledge of about one semester of university studies in mathematics and physics is required including vector algebra integral and differential calculus as well as a course in mechanics treating Newton's laws and the energy principle The target groups are physics and engineering students as well as professionals in the field such as high school teachers and employees in the telecom industry Chemistry and computer science students may also benefit from the book
