Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were divided into two groups: a control group and a training group. The control group consisted of 10 men who did not exercise regularly, and the training group consisted of 10 men who participated in a 10-week training program. The training program consisted of three sessions per week, each lasting 30 minutes, and included aerobic and resistance training. The HR and BP were measured at baseline and at the end of the 10-week training program. The results showed that the training group had a significant decrease in both HR and BP compared to the control group. The HR decreased from 72 to 68 beats per minute, and the BP decreased from 120/80 to 110/70 mmHg. These findings suggest that a 10-week training program can effectively reduce HR and BP in sedentary, middle-aged men.

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The physical health of the women was assessed using a series of physical fitness tests, including a 1-mile walk test, a 6-minute walk test, and a 12-minute step test. The psychological health of the women was assessed using a series of psychological tests, including a Beck Depression Inventory, a State-Trait Anxiety Inventory, and a Visual Analog Scale. The results of the study showed that the walking program had a significant positive effect on the physical and psychological health of the women. The women in the walking program showed significant improvements in physical fitness, including a decrease in heart rate, an increase in walking speed, and an increase in the number of steps taken. The women in the walking program also showed significant improvements in psychological health, including a decrease in depression and anxiety scores, and an increase in self-rated health. The results of this study suggest that a 12-week, low-intensity, supervised walking program can have a significant positive effect on the physical and psychological health of sedentary, middle-aged women.
