Chan, 2010-02-11 This in depth detailed reference presents for the first time a comprehensive treatment of recent advances in optical performance monitoring Written by leading experts in the field the book provides an overview of recent developments in the area and the role of OPM in future optical systems and networks Detailed discussions of various advanced techniques are provided to illustrate their principles FEATURES Presents the principles and applications of advanced OPM techniques together with a comparative evaluation of their effectiveness in monitoring individual parameters such as optical signal to noise ratio chromatic dispersion and polarization mode dispersion Explains the principles of the various advanced optical signal processing techniques and their applications in OPM Examines the role and applications of OPM in optical networks including optical transport networks coherent optical systems and long haul optical transmission systems Discusses the current approaches of OPM in the global standard SDH SONET This book is ideal for technical professionals and researchers who want to understand and evaluate advanced techniques in OPM and their impact on the practical design of next generation optical systems and networks Provides a thorough and detailed discussion of the latest optical performance monitoring OPM techniques and their applications presenting a comparative analysis of each method Contains high quality technical contributions from leading experts covering both principles and practical aspects of advanced OPM techniques Addresses challenges and opportunities related to OPM in next generation reconfigurable optical systems and networks

Advanced Performance Monitoring in All-Optical Networks Yannis Benlachtar, 2010-09 This thesis investigates advanced optical performance monitoring approaches for future all optical networks using the synchronous sampling technique This allows for improved signal quality estimation fault management and resource allocation through improved control of transmission at the physical layer level Because of the increased transparency in next generation networks it is not possible to verify the quality of the signal at each node because of the limited number of optical electrical optical conversions and therefore new non intrusive mechanisms to achieve signal quality monitoring are needed The novel synchronous sampling technique can be deployed to estimate the bit error rate considered an important quality measure and hence can be utilised to certify service level agreements between operators and customers This method also has fault identification capabilities by analysing the shapes of the obtained histograms Each impairment affects the histogram in a specific way giving it a unique shape that can be used for root cause analysis

Progress in Optical Fibers Research Zhijian Guo, 2007 This book presents new and important research on optical fibres An optical fibre is a glass or plastic fibre designed to guide light along its length by confining as much light as possible in a propagating form In fibres with large core diameter the confinement is based on total internal reflection In smaller diameter core fibres widely used for most communication links longer than 200 meters the confinement relies on establishing a waveguide Fibre optics is

the overlap of applied science and engineering concerned with such optical fibres Optical fibres are widely used in fibre optic communication which permits transmission over longer distances and at higher data rates than other forms of wired and wireless communications They are also used to form sensors and in a variety of other applications The term optical fibre covers a range of different designs including graded index optical fibres step index optical fibres birefringent polarisation maintaining fibres and more recently photonic crystal fibres with the design and the wavelength of the light propagating in the fiber dictating whether or not it will be multi mode optical fibre or single mode optical fibre Because of the mechanical properties of the more common glass optical fibres special methods of splicing fibres and of connecting them to other equipment are needed Manufacture of optical fibres is based on partially melting a chemically doped preform and pulling the flowing material on a draw tower Fibers are built into different kinds of cables depending on how they will be used
