L. Morison, Michael D. Morecroft, 2008-04-15 Evidence grows daily of the changing climate and its impact on plants and animals Plant function is inextricably linked to climate and atmospheric carbon dioxide concentration On the shortest and smallest scales the climate affects the plant's immediate environment and so directly influences physiological processes At larger scales the climate influences species distribution and community composition as well as the viability of different crops in managed ecosystems Plant growth also influences the local regional and global climate through the exchanges of energy and gases between the plants and the air around them Plant Growth and Climate Change examines the major aspects of how anthropogenic climate change affects plants focusing on several key determinants of plant growth atmospheric CO₂ temperature water availability and the interactions between these factors The book demonstrates the variety of techniques used across plant science detailed physiology in controlled environments observational studies based on long term data sets field manipulation experiments and modelling It is directed at advanced level university students researchers and professionals across the range of plant science disciplines including plant physiology plant ecology and crop science It will also be of interest to earth system scientists **The SAGE Handbook of Biogeography** Andrew Millington, Mark Blumler, Udo Schickhoff, 2011-09-22 A superb resource for understanding the diversity of the modern discipline of biogeography and its history and future especially within geography departments I expect to refer to it often Professor Sally Horn University of Tennessee As you browse through this fine book you will be struck by the diverse topics that biogeographers investigate and the many research methods they use Biogeography is interdisciplinary and a commonly

voiced concern is that one biogeographer may not readily understand another's research findings. A handbook like this is important for synthesising, situating, explaining and evaluating a large literature and pointing the reader to informative publications. Geographical Research: A valuable contribution in both a research and teaching context. If you are biologically trained, it provides an extensive look into the geographical tradition of biogeography covering some topics that may be less familiar to those with an evolution/ecology background. Alternatively, if you are a geography student, researcher or lecturer, it will provide a useful reference and will be invaluable to the non-biogeographer who suddenly has the teaching of an introductory biogeography course thrust upon them.

Adam C. Algar, *Frontiers of Biogeography*. The SAGE Handbook of Biogeography is a manual for scoping the past, present and future of biogeography that enable readers to consider where relevant how similar biogeographical issues are tackled by researchers in different schools. In line with the concept of all SAGE Handbooks, this is a retrospective and prospective overview of biogeography that will consider the main areas of biogeography researched by geographers. Detail a global perspective by incorporating the work of different schools of biogeographers. Explore the divergent evolution of biogeography as a discipline and consider how this diversity can be harnessed. Examine the interdisciplinary debates that biogeographers are contributing to within geography and the biological sciences. Aimed at an international audience of research students, academics, researchers and practitioners in biogeography, the text will attract interest from environmental scientists, ecologists, biologists and geographers alike.

Forests, Carbon Cycle and Climate Change Denis Loustau, 2010-03-04. The results presented in this book summarize the main findings of the CARBOFOR project, which brought together 52 scientists from 14 research units to investigate the effects of future climate on the carbon cycle, the productivity and vulnerability of French forests. This book explains the current forest carbon cycle in temperate and Mediterranean climates, including the dynamics of soil carbon and the total carbon stock of French forests.

based on forest inventories It reviews and illustrates the main ground based methods for estimating carbon stocks in tree biomass Spatial variations in projected climate change over metropolitan France throughout the 21st century are described The book then goes on to consider the impacts of climate change on tree phenology and forest carbon balance evapotranspiration and production as well as their first order interaction with forest management alternatives The impact of climate change on forest vulnerability is analysed A similar simulation study was carried out for a range of pathogenic fungi emphasizing the importance of both warming and precipitation changes The consequences of climate change on the occurrence of forest fires and the forest carbon cycle in the Mediterranean zone are also considered A valuable reference for researchers and academics forest engineers and managers and graduate level students in forest ecology ecological modelling and forestry
