Beginner's Guide to Flowers

Flower Growth

Stage 1: sprouts
Stage 2: stems
Stage 3: buds
Stage 4: flower!

Picked flowers return to stage 2, trampled to stage 3. Flowers planted on the beach cannot progress through the stages!

Watering

Watering a stage 3/4 flower daily creates a chance for it to produce a new flower.

Visitors from other islands can water your flowers to boost production chance!

Flowers that are watered for the day are sparkly!

Genotype

Each flower has 3 genes (4 for roses), which are a combination of hidden numbers that determine its color.

However, there are multiple possible gene combinations for the same color flower!

Pro-tip: avoid using breeding guides that only rely on color!

Breeding

Breeding means to put flowers of the same species together to try to create new colors. Two flowers' (parents) genes are randomly mixed together to form the genotype of the new flower that CAN be a new color.

You can get a maximum of 1 flower offspring per pair of 2 parents per day.

(read up on Mendelian inheritance for science-y stuff!)

vs.

Cloning

Cloning means to create an exact copy of the flower without changing genes. When cloning, we don't want the flower to touch any other flower of the same species to prevent breeding.

This is great for if you have your desired flower already and you want to make more! Cloning is more efficient than breeding. You can get 1 clone per 1 parent per day!

Bad Luck Bonus

Flowers have a hidden "water counter" to prevent bad luck.

A flower that was watered but does not produce will add 1 to the counter.

A flower with a water counter value over 3 has additional bonus production chance!
