Step by Step Tutorial IMAGE CLASSIFICATION Using Scikit-Learn, Keras, And TensorFlow with PYTHON GUI Vivian Siahaan,2023-06-21 In this book implement deep learning based image classification on classifying monkey species recognizing rock paper and scissor and classify airplane car and ship using TensorFlow Keras Scikit Learn OpenCV Pandas NumPy and other libraries In chapter 1 you will learn how to use TensorFlow Keras Scikit Learn OpenCV Pandas NumPy and other libraries to perform how to classify monkey species using 10 Monkey Species dataset provided by Kaggle <https://www.kaggle.com/slothkong/10-monkey>

species download Here s an overview of the steps involved in classifying monkey species using the 10 Monkey Species dataset

Dataset Preparation Download the 10 Monkey Species dataset from Kaggle and extract the files The dataset should consist of separate folders for each monkey species with corresponding images

Load and Preprocess Images Use libraries such as OpenCV to load the images from the dataset Resize the images to a consistent size e g 224x224 pixels to ensure uniformity

Split the Dataset Divide the dataset into training and testing sets Typically an 80 20 or 70 30 split is used where the larger portion is used for training and the smaller portion for testing the model s performance

Label Encoding Encode the categorical labels monkey species into numeric form This step is necessary to train a machine learning model as most algorithms expect numerical inputs

Feature Extraction Extract meaningful features from the images using techniques like deep learning or image processing algorithms This step helps in representing the images in a format that the machine learning model can understand

Model Training Use libraries like TensorFlow and Keras to train a machine learning model on the preprocessed data Choose an appropriate model architecture in this case MobileNetV2

Model Evaluation Evaluate the trained model on the testing set to assess its performance Metrics like accuracy precision recall and F1 score can be used to evaluate the model s classification performance

Predictions Use the trained model to make predictions on new unseen images Pass the images through the trained model and obtain the predicted labels for the monkey species

In chapter 2 you will learn how to use TensorFlow Keras Scikit Learn OpenCV Pandas NumPy and other libraries to perform how to recognize rock paper and scissor using dataset provided by Kaggle <https://www.kaggle.com/sanikamal/rock-paper-scissors-dataset>

download Here s the outline of the steps

Step 1 Dataset Preparation Download the rock paper scissors dataset from Kaggle by visiting the provided link and clicking on the Download button Save the dataset to a local directory on your machine Extract the downloaded dataset to a suitable location This will create a folder containing the images for rock paper and scissors

Step 2 Data Preprocessing Import the required libraries TensorFlow Keras NumPy OpenCV and Pandas Load the dataset using OpenCV Iterate through the image files in the dataset directory and use OpenCV s cv2.imread function to load each image You can specify the image s file extension e g PNG and directory path Preprocess the images Resize the loaded images to a consistent size using OpenCV s cv2.resize function You may choose a specific width and height suitable for your model Prepare the labels Create a list or array to store the corresponding labels for each image rock paper or scissors This can be done based on the file naming convention or by mapping images to their respective labels using a dictionary

Step 3 Model Training Create a convolutional neural network CNN model using Keras Define a CNN architecture using Keras Sequential model or functional API This typically consists of convolutional layers pooling layers and dense layers Compile the model Specify the loss function e g categorical cross entropy and optimizer e g Adam using Keras compile function You can also define additional metrics to evaluate the model s performance Train the model Use Keras fit function to train the model on the preprocessed dataset Specify the training data labels batch size number of epochs and validation data if available This

will optimize the model's weights based on the provided dataset. Save the trained model. Once the model training is complete, you can save the trained model to disk using Keras `save` or `save_weights` function. This allows you to load the model later for predictions or further training.

Step 4: Model Evaluation Evaluate the trained model. Use Keras `evaluate` function to assess the model's performance on a separate testing dataset. Provide the testing data and labels to calculate metrics such as accuracy, precision, recall, and F1 score. This will help you understand how well the model generalizes to new unseen data. Analyze the model's performance. Interpret the evaluation metrics and analyze any potential areas of improvement. You can also visualize the confusion matrix or classification report to gain more insights into the model's predictions.

Step 5: Prediction Use the trained model for predictions. Load the saved model using Keras `load_model` function. Then pass new unseen images through the model to obtain predictions. Preprocess these images in the same way as the training images: `resize`, `normalize`, etc. Visualize and interpret predictions. Display the predicted labels alongside the corresponding images to see how well the model performs. You can use libraries like Matplotlib or OpenCV to show the images and their predicted labels. Additionally, you can calculate the accuracy of the model's predictions on the new dataset.

In chapter 3, you will learn how to use TensorFlow, Keras, Scikit Learn, OpenCV, Pandas, NumPy, and other libraries to perform how to classify airplane, car, and ship using Multiclass image dataset (airplane, car, ship) dataset provided by Kaggle (<https://www.kaggle.com/abtaabm/multiclassimage-dataset-airplane-car>). Here are the outline steps:

- Import the required libraries: TensorFlow, Keras, Scikit Learn, OpenCV, Pandas, NumPy.
- Load and preprocess the dataset: Read the images from the dataset folder. Resize the images to a fixed size. Store the images and corresponding labels.
- Split the dataset into training and testing sets: Split the data and labels into training and testing sets using a specified ratio.
- Encode the labels: Convert the categorical labels into numerical format. Perform one-hot encoding on the labels.
- Build MobileNetV2 model using Keras: Create a sequential model. Add convolutional layers with activation functions. Add pooling layers for downsampling. Flatten the output and add dense layers. Set the output layer with softmax activation.
- Compile and train the model: Compile the model with an optimizer and loss function. Train the model using the training data and labels. Specify the number of epochs and batch size.
- Evaluate the model: Evaluate the trained model using the testing data and labels. Calculate the accuracy of the model. Make predictions on new images.
- Load and preprocess a new image: Use the trained model to predict the label of the new image. Convert the predicted label from numerical format to categorical.

sometimes known as sentiment analysis or emotion AI refers to the use of natural language processing text analysis
computational linguistics and biometrics to systematically identify extract quantify and study affective states and subjective
information This dataset was created for the Paper From Group to Individual Labels using Deep Features Kotzias et al KDD
2015 It contains sentences labelled with a positive or negative sentiment Score is either 1 for positive or 0 for negative The
sentences come from three different websites fields imdb com amazon com and yelp com For each website there exist 500
positive and 500 negative sentences Those were selected randomly for larger datasets of reviews Amazon contains reviews
and scores for products sold on amazon com in the cell phones and accessories category and is part of the dataset collected
by McAuley and Leskovec Scores are on an integer scale from 1 to 5 Reviews considered with a score of 4 and 5 to be
positive and scores of 1 and 2 to be negative The data is randomly partitioned into two halves of 50% one for training and one
for testing with 35 000 documents in each set IMDb refers to the IMDb movie review sentiment dataset originally introduced
by Maas et al as a benchmark for sentiment analysis This dataset contains a total of 100 000 movie reviews posted on imdb
com There are 50 000 unlabeled reviews and the remaining 50 000 are divided into a set of 25 000 reviews for training and
25 000 reviews for testing Each of the labeled reviews has a binary sentiment label either positive or negative Yelp refers to
