Chapter Six PROGRAMMING LANGUAGES

Chapter Summary

This chapter begins with a short history of programming languages. It presents the classification of languages by generations and also points out that such a linear classification scheme fails to capture the true diversity of languages today. To support this claim, the chapter introduces the declarative, functional, and object-oriented paradigms as alternatives to the more traditional imperative approach. There are separate sections later in the chapter on both the object-oriented and declarative paradigms.

The chapter also presents some common structures found in third-generation imperative and object-oriented languages, drawing examples from Ada, C, C++, COBOL, FORTRAN, and Java. Topics covered include declaration statements, control statements, functions, and parameter passing. An additional section extends this study to include topics associated with object-oriented languages.

To bridge the gap between high-level languages and machine language, this chapter discusses the rudiments of language translation, including the basic steps of lexical analysis, parsing, and code generation.

Optional sections introduce parallel programming, and explore declarative programming via logic programming and the language Prolog.

Comments

1. This chapter is intended to serve one of two roles, depending on the programming background of the audience. For those with previous programming experience, the chapter can be approached as an introduction to the subject of language design and implementation. For those with no programming experience, the chapter can serve as a generic introduction to programming languages or a context in which a particular language can be emphasized.
