1. **Explain the difference between a point estimate and a confidence interval.**
A point estimate is a single value that serves as an estimate of a population parameter. A confidence interval is a range of values that is likely to contain the true population parameter.
2. **Describe the Central Limit Theorem and its importance in statistics.**
The Central Limit Theorem states that the distribution of sample means will approach a normal distribution as the sample size increases, regardless of the shape of the population distribution.
3. **Define the standard error of the mean and explain how it is calculated.**
The standard error of the mean (SEM) is the standard deviation of the sampling distribution of the sample mean. It is calculated as the population standard deviation divided by the square root of the sample size.
4. **Explain the difference between a z-test and a t-test.**
A z-test is used when the population standard deviation is known and the sample size is large. A t-test is used when the population standard deviation is unknown and the sample size is small.
5. **Describe the process of hypothesis testing and the role of the p-value.**
Hypothesis testing is a statistical method used to test a claim about a population parameter. The p-value is the probability of observing a test statistic as extreme as the one calculated, assuming the null hypothesis is true.
6. **Explain the difference between a one-tailed test and a two-tailed test.**
A one-tailed test is used when the researcher is interested in a specific direction of effect. A two-tailed test is used when the researcher is interested in any effect, regardless of direction.
7. **Define the concept of statistical power and explain how it is related to sample size.**
Statistical power is the probability of correctly rejecting the null hypothesis when it is false. It is related to sample size, as larger samples generally result in higher power.
8. **Explain the difference between a confidence interval and a prediction interval.**
A confidence interval estimates the range of values for a population parameter. A prediction interval estimates the range of values for an individual observation.
9. **Describe the process of regression analysis and the role of the regression line.**
Regression analysis is a statistical method used to model the relationship between a dependent variable and one or more independent variables. The regression line is the line of best fit for the data.
10. **Explain the difference between a linear regression model and a logistic regression model.**
A linear regression model is used to predict a continuous outcome variable. A logistic regression model is used to predict a binary outcome variable.
11. **Define the concept of a p-value and explain how it is used in hypothesis testing.**
The p-value is the probability of observing a test statistic as extreme as the one calculated, assuming the null hypothesis is true. It is used to determine whether to reject the null hypothesis.
12. **Explain the difference between a Type I error and a Type II error.**
A Type I error is a false positive, where the null hypothesis is rejected when it is actually true. A Type II error is a false negative, where the null hypothesis is not rejected when it is actually false.
