(Hemiptera - Heteroptera, Gerromorpha & Nepomorpha)** Nils Møller Andersen, Tom A. Weir, 2021-10-25 Water bugs are familiar insects in aquatic habitats throughout the World They belong to the order Hemiptera the largest insect order with incomplete metamorphosis There are basically two kinds 1 the semiaquatic bugs Gerromorpha which live upon the water surface and 2 the true water bugs Nepomorpha which live beneath the water surface Water bugs are found in a wide variety of natural habitats from small temporary pools to larger ponds and lakes from small streams to rivers and from inland freshwater bodies to coastal mangroves tidal pools of coral reefs and the surface of the ocean Water bugs are chiefly predators or scavengers feeding on any prey they can master from tiny crustaceans and insects to tadpoles and small fish They play a major role in aquatic ecosystems and may serve as indicators of the biological quality of aquatic habitats They are chiefly beneficial to man since many species prey on mosquitoes and are themselves preyed upon by fish Because of their diverse lifestyles and because they are easily observed in their natural habitats water bugs are excellent model organisms in evolutionary biology ecology and conservation biology This handbook is the first comprehensive guide facilitating the identification of Australian water bugs It provides an overview on all 15 families 17 subfamilies and 55 genera known to occur on mainland Australia Tasmania and nearby islands Illustrated keys featuring a minimum of technical language are offered to assist with the identification of adult water bugs For each genus the handbook includes a description of the characters used to identify the genus and to separate the genus from similar genera an illustration to show overall appearance habitus of a representative species an illustrated key to species recorded from Australia overview of the biology of the genus and a map showing the locations where the genus has been found in Australia **An Introduction to Australian Insects** Phillip W. New, 2018-08-27 Losses of forests and their insect inhabitants are a major global conservation concern spanning tropical and

temperate forest regions throughout the world This broad overview of Australian forest insect conservation draws on studies from many places to demonstrate the diversity and vulnerability of forest insects and how their conservation may be pursued through combinations of increased understanding forest protection and silvicultural management in both natural and plantation forests The relatively recent history of severe human disturbance to Australian forests ensures that reasonably natural forest patches remain and serve as models for many forest categories They are also refuges for many forest biota extirpated from the wider landscapes as forests are lost and merit strenuous protection from further changes and wider efforts to promote connectivity between otherwise isolated remnant patches In parallel the recent attention to improving forest insect conservation in harmony with insect pest management continues to benefit from perspectives generated from better documented faunas elsewhere Lessons from the northern hemisphere in particular have led to revelations of the ecological importance and vulnerability of many insect taxa in forests together with clear evidence that conservation can work in concert with wider forest uses A brief outline of the variety of Australian tropical and temperate forests and woodlands and of the multitude of endemic and often highly localised insects that depend on them highlights needs for conservation both of single focal species and wider forest dependent radiations and assemblages The ways in which insects contribute to sustained ecological integrity of these complex ecosystems provide numerous opportunities for practical conservation

Insect conservation and Australia's Inland Waters Tim R. New, 2020-11-28 The first broad overview of conservation needs of Australia's largely endemic freshwater insects drawing on examples and information from many parts of the world to illustrate and develop needs and practical prospects for conservation in inland water environments The wide variety of those environments in Australia and their diverse insect inhabitants many of them highly localised and ecologically specialised and vulnerable and threats to them is illustrated Case histories demonstrate the different aspects of practical conservation management that may be possible in different contexts and numerous references facilitate understanding by non specialist readers and non entomologist conservation managers and practitioners *'In Considerable Variety': Introducing the Diversity of Australia's Insects* Tim R. New, 2011-08-29 The book introduces basic entomology emphasising perspectives on insect diversity important in conservation assessment and setting priorities for management as a foundation for managers and others without entomological training or background It bridges the gap between photographic essays on insect identification and more technical texts to illustrate and discuss many aspects of taxonomic ecological and evolutionary diversity in the Australian insect fauna and its impacts in human life through outlines of many aspects of insect natural history
