An Introduction To Stata Programming Second Edition:

An Introduction to Stata Programming Christopher F. Baum, 2009-03-18 This work focuses on three types of Stata programming: do file programming, ado file programming, and Mata functions that work in conjunction with do and ado files. It explains how to usefully automate work with Stata and how to use Stata more effectively through programming on one or more of these levels. After presenting elementary concepts of the command line interface and commonly used tools for working with programs and data sets, the text follows a unique format by offering cookbook chapters after each main chapter. These cookbook chapters look at how to perform a specific programming task with Stata and provide a complete solution to the problem. The text also includes numerous examples of Mata, Stata's matrix programming language. *A Gentle Introduction to Stata, Second Edition* Alan C. Acock, 2008-09-03 *A Gentle Introduction to Stata* Second Edition is aimed at new Stata users who want to become proficient in Stata. After reading this introductory text, new users will not only be able to use Stata well but also learn new aspects of Stata easily. Acock assumes that the user is not familiar with any statistical software. This assumption of a blank slate is central to the structure and contents of the book. Acock starts with the basics; for example, the portion of the book that deals with data management begins with a careful and detailed example of turning survey data on paper into a Stata-ready dataset on the computer. When explaining how to go about basic exploratory statistical procedures, Acock includes notes that should help the reader develop good work habits. This mixture of explaining good Stata habits and good statistical habits continues throughout the book. Acock is quite careful to teach the reader all aspects of using Stata. He covers data management, good work habits including the use of basic do files, basic exploratory statistics including graphical displays and analyses using the standard array of basic statistical tools: correlation, linear and logistic regression, and parametric and nonparametric tests of location and dispersion. Acock teaches Stata commands by using the menus and dialog boxes while still stressing the value of do files. In this way, he ensures that all types of users can build good work habits. Each chapter has exercises that the motivated reader can use to reinforce the material. The tone of the book is friendly and conversational without ever being glib or condescending. Important asides and notes about terminology are set off in boxes, which makes the text easy to read without any convoluted twists or forward referencing. Rather than splitting topics by their Stata implementation, Acock chose to arrange the topics as they would be in a basic statistics textbook: graphics and postestimation are woven into the material in a natural fashion. Real datasets such as the General Social Surveys from 2002 and 2006 are used throughout the book. The focus of the book is especially helpful for those in psychology and the social sciences because the presentation of basic statistical modeling is supplemented with discussions of effect sizes and standardized coefficients. Various selection criteria such as semipartial correlations are discussed for model selection. The second edition of the book has been updated to reflect new features in Stata 10 and includes a new chapter on the use of factor analysis to develop valid, reliable scale measures.
