Course description and objectives: This course will offer a survey of the main themes, theories, and approaches developed in the field of Science and Technology Studies (STS). Graduate students will have the opportunity to explore concepts and methods that will enable them to develop their projects in the history of science and technology according to traditional and current theoretical debates in the field. In the last three decades history of science and technology scholars have contributed enormously to the development of STS, and at the same time have adopted concepts and shared perspectives of contiguous disciplines, such as sociology and anthropology of science. The selection of readings described in detail below, reflects this consolidated and fruitful interdisciplinary approach. In addition to this, in recent years engineering and medical schools, but also physical and biological sciences department, have introduced social studies of science in their curricula. For this reason, while it is intended to satisfy the needs of graduate students in the history department (and other humanities and social science units) this course offers students from other disciplines, including engineering, medicine, and geo-physical sciences, an opportunity to engage critically with problems and questions concerning the social impact and relevance of scientific research and applied science.

The format of the course will be that of a graduate colloquium, which meets for three hours once a week. The main goal is to give students the opportunity to discuss relevant themes in Science and Technology Studies through the reading of classic works in the field and through a selection of current themes/debates, such as climate change, energy politics, and the relative socio-technical controversies, to which STS scholars have contributed through their analyses and policy-oriented discussions.

The evaluation of students' work will be based on weekly response papers, and a final paper of their choice, exploring one of the themes discussed during the course. The goal of the short weekly papers is to develop writing abilities and a style that privileges synthesis and straightforwardness in addressing theoretical and methodological questions. This will also contribute to the professionalization of graduate students who will have to submit conference and article proposals. Each weekly paper will be graded. The average of weekly papers' grades and in class participation will amount to the 70% of the final grade. The remaining 30% will be based on the evaluation of a final paper (of about 20-

An Introduction to Science Studies John M. Ziman, 1987-07-23 The purpose of this book is to give a coherent account of the different perspectives on science and technology that are normally studied under various disciplinary heads such as philosophy of science sociology of science and science policy It is intended for students embarking on courses in these subjects and assumes no special knowledge of any science It is written in a direct and simple style and technical language is introduced very sparingly As various perspectives are sketched out in this book the reader moves towards a consistent conception of contemporary science as a rapidly changing social institution that has already grown out of its traditional forms and plays a central role in society at large It will appeal to students in a wide range of scientific disciplines and complement well Professor Ziman's earlier books
